Minnesota Population Projections 2000-2030

Minnesota Planning develops long-range plans for the state, stimulates public participation in Minnesota's future and coordinates activities among state agencies, the Minnesota Legislature and other units of government.

Minnesota Population Projections 2000-2030 was prepared by Martha McMurry of the State Demographic Center.

Upon request, this report will be made available in alternate format, such as Braille, large print or audio tape. For TTY, contact Minnesota Relay Service at 800-627-3529 and ask for Minnesota Planning.

October 2002

For additional copies of this report or other population information, contact the State Demographic Center helpline at 612-296-2557.

Minnesota Population Projections 2000-2030

Minnesota's population is projected to grow to 5,452,500 by 2010 and 6,268,200 by 2030. This growth will be fueled by in-migration from other states and foreign countries and by natural increase (more births than deaths).

Growth will be greatest in Twin Cities area suburban counties. The St. Cloud and Rochester areas and the lakes area of north central Minnesota will also see strong growth throughout the next 30 years. Many counties in western Minnesota will continue to lose population, though the losses will be moderate in most cases.

The aging of the baby boom will produce an explosion in the 45- to 64-year old population between 2000 and 2010, and the over-55 population will grow by more than 2 million in the coming 30 years. The median age will rise from 35.4 years in 2000 to 40.2 years in 2030.

The projections shown in this report are higher than those in previous projections series published in 1993 and 1998. Population growth in Minnesota in the 1990s was higher than anticipated, reflecting the strong economy that led to greater in-migration from other states and countries. The projections assume that Minnesota will continue to experience net in-migration throughout the coming decades, though the level of in-migration

Minnesota projected median age, 2000 to 2030

2000	35.4
2005	36.2
2010	36.8
2015	37.4
2020	38.4
2025	39.3
2030	40.2

Projected numbers calculated from age group data.

will taper off. Additional assumptions are that fertility rates will not change and that life expectancy will continue to increase. For more details on assumptions and methodology, see the end of this report.

Births and deaths both expected to rise

Births are projected to rise steadily between 2000 and 2015 and then to level off. Births will be at their highest level since the 1960s,

■ Males ■ Females

with almost 76,000 births anticipated in 2015. By comparison, births in the 1990s were in the range of 63,000 to 68,000 annually.

Fertility rates by age are projected to remain constant, so the reason for the increase in births is a rise in the female population of childbearing age. Between 2000 and 2015 the projected population of women 20 to 34, the age when women

are most likely to have children, is expected to increase by 20 percent.

Deaths will increase from about 191,000 between 2000 and 2005 to almost 247,000 between 2025 and 2030. Even though people are expected to live longer, the number of deaths will rise as the size of the population increases and the elderly population grows rapidly.

Natural increase will account for two-thirds of growth

Natural increase, the excess of births over deaths, will contribute about two-thirds of projected population growth over the next 30 years. Though deaths will rise, this will be largely counterbalanced by the increase in births. Natural increase is expected to peak at more than 167,000 between

2010 and 2015, then fall to about 128,000 between 2025 and 2030.

Natural increase will be greatest in faster-growing counties with younger populations. Areas with older populations and less growth, mostly in western and northeastern Minnesota, will have more deaths than births. By 2025 to 2030, 33 of 87 counties are projected to have natural decrease.

Births in Minnesota projected to rise until 2015, then level off

Number of births Thousands

Sources: Minnesota Center for Health Statistics; Minnesota State Demographic Center

Migration will contribute to population growth

Minnesota is projected to experience net in-migration throughout the projections period. However, net in-migration will taper off over time, falling from about 129,000 between 2000 and 2005 to about 41,000 between 2025 and 2030. Net in-migration is expected to account for about one-third of all growth over the next 30 years.

Number of Minnesota deaths is projected to rise

Source: Minnesota State Demographic Center
Numbers are rounded

2000 to 2010 growth expected to be substantial

Over the next 10 years, Minnesota's population is projected to grow by 533,000, or about 11 percent. This is similar to the level of growth experienced in the 1990s.

About 81 percent of all growth will occur in metropolitan areas, with 73 percent of the gain in the Minneapolis-St. Paul metropolitan area alone. Scott (37 percent), Sherburne (34 percent) and Carver (31 percent) are projected to be the fastest-growing counties. Twenty-one counties, mostly in western Minnesota, are projected to lose population during the coming decade.

Minnesota population projected to grow 27 percent from 2000 to 2030

Minnesota's population is projected to pass 6 million by 2025 and to reach 6,268,200 by 2030. This represents a gain of 27 percent, or about 1.35 million people in 30 years.

Only 13 counties are projected to have a lower population in 2030 than in 2000. The most rapid gains are projected for Scott (103 percent), Sherburne (89 percent) and Carver (85 percent) counties.

Over the 30-year period, metropolitan areas are projected to grow 30 percent compared to 21 percent for

Projected deaths compared to births 2025 to 2030

Source: Minnesota State Demographic Center

nonmetropolitan areas. About 77 percent of all growth will occur in metropolitan areas, with 68 percent of all growth in the Minneapolis-St. Paul metropolitan area.

Population age 0-14 will grow in suburban counties, fall in western Minnesota

The number of children age 0 to 14 is projected to fall slightly between 2000 and 2005, then rise at a modest rate throughout the remainder of the projections period. Overall, the child population will grow about 10 percent over the coming 30 years.

Most of the gain in the child population will occur in counties that attract young families, particularly in the Twin Cities suburbs. Over the next 10 years, Scott County is projected to see an increase of more than 5,000 children. Gains of more than 3,000 children are projected

for Washington, Sherburne and Dakota counties. At the other extreme, declines of 15 percent or more are projected for Koochiching, Traverse, Murray, Big Stone, Wilkin and Lac qui Parle counties. Most of the western half of the state can anticipate falling child populations and, consequently, continued declines in school enrollments.

Population age 15 to 24 will grow about 20 percent over 30 years

The population age 15 to 24 is projected to rise between 2000 and 2010 and remain fairly steady thereafter. It will fall slightly between 2010 and 2020 and then rise again. Overall, this age group will grow about 10 percent over a 30-year period. The 15- to 24-year old population will remain concentrated in large urban counties and in counties with college and university campuses.

Source: Minnesota State Demographic Center
Numbers are rounded

Projected population change 2000 to 2010

Source: Minnesota State Demographic Center

Projected population growth rate 2000 to 2010

Source: Minnesota State Demographic Center

Size of 25- to 44-year old age group will not change dramatically

The number of 25-to-44-year olds is projected to remain fairly stable, falling slightly between 2000 and 2005 and rising slightly thereafter. Overall, the size of this age group is expected to increase about 7 percent from 2000 to 2030, well below the growth rate for the total population.

Like the child population, the 25-to 44-year old group will grow the most in suburban counties such as Washington, Dakota, Scott, Sherburne and Carver. Though suburban counties and some others will see gains, the majority of counties will experience a decline in this age group over the next 30 years. Employers in these counties, especially in western Minnesota, will have

problems finding employees in this prime working age group.

Age 45 to 64 will see huge growth from 2000 to 2015

The aging of the baby boom will produce a huge increase in the number of 45- to-64-year olds between 2000 and 2015. After 2015, as more boomers start to leave this age bracket, the number will level off. Statewide, the age group

will grow 36 percent from 2000 to 2010. The 2030 number will be about the same as the 2010 number.

Every county in the state, even those expected to lose population, will have an increase in the 45- to-64-year old age group. Over the 30-year period, gains of more than 50 percent are expected in growing suburban counties such as Carver,

Scott, Sherburne, Chisago, Washington, Wright and Dakota.

Age 65 and older will soar after 2015

The elderly population will rise moderately between 2000 and 2010, with an expected gain of 14 percent. After 2015, growth in this age group will be extremely rapid as baby boomers pass their 65th

birthdays. The 65-plus age group is projected to grow by almost 700,000 between 2000 and 2030, a growth rate of 117 percent.

In the next 10 years, the senior population is projected to grow by more than 6,000 in each of the largest Twin Cities counties: Hennepin, Dakota, Anoka, Washington and Ramsey. Retirement magnets such as Crow Wing, Cass, Aitkin and

Hubbard counties will see rapid growth in this age group.

The effect of Minnesota's aging population will be most visible in suburban areas where the middle-aged population is concentrated today. The elderly population will more than triple in most suburban counties between 2000 and 2030.

Increases in the 65-plus population will be more modest in rural areas of western Minnesota. The older population is projected to fall in many of these counties between 2000 and 2010, reflecting the small size of the middle-aged population living there now. After 2015, growth in the older population should resume throughout the state because of the baby boom effect. Gains in western Minnesota will be small compared to gains in other areas of the state, however.

Suburban and lakes counties will see big gains in 85+ population

The 85 and older population is projected to grow 25 percent in this decade and 91 percent between 2000 and 2030. Though the 2000 to 2010 growth is considerable, it is well below the growth in this age group seen in recent decades. Low birthrates in the late 1920s and the 1930s are slowing the rate of growth in the elderly population, and this will affect the number of people moving into extreme old age.

Suburban counties such as Washington, Scott and Anoka and lakes area counties such as Cass and Hubbard are projected to see dramatic growth in the 85 and older population in the next 30 years. The 85-plus population is expected to grow 298 percent in Washington County, 289 percent in Scott County and 270 percent in Anoka County

Source: Minnesota State Demographic Center

between 2000 and 2030. The aging of current middle-aged and young elderly residents is the major reason for this tremendous rise. In the lakes area, in-migration of retirees who then age in place will also contribute to growth.

Increases in the 85 and older group will be far more modest in western Minnesota. In

Jackson, Traverse, Kittson, and Lac qui Parle counties, the extremely old population is anticipated to grow less than 5 percent from 2000 to 2030.

Methodology

The population projections presented in this publication were prepared using the cohort-component method.

Projected % change in population 25 to 44 2000 to 2010

Source: Minnesota State Demographic Center

The 2000 census population by age and gender from the U.S. Census Bureau provided the starting point. Assumptions were then made about the rates of mortality, fertility and migration during each five-year period. The population at the end of each time period reflects the expected number of survivors, births during the period,

and additions or subtractions attributable to migration. The projected population then becomes the basis for the next cycle of projections calculations. County projections in each age-sex group were controlled to the state totals. Regional and metropolitan area projections were derived by adding up the counties in the

region or metropolitan area. Metropolitan area definitions are those established by the federal Office of Management and Budget in 1999. (See <http://www.whitehouse.gov/omb/infoereg/msa-bull99-04.html>)

Mortality assumptions

Survival rates were assumed to be the same in the state and all its counties. The projections assume that survival rates will increase at the same rate shown in the national projections prepared by the U.S. Census Bureau and benchmarked to 1999 estimates. See <http://www.census.gov/population/www/projections/natproj.html> for more information about these national projections. The national changes in survival rates were applied to the 2000 Minnesota survival rates. (See *Population Notes*, April 2002.) In 2000 Minnesota's life expectancy was above the national average, and this difference is expected to

continue. Most improvement in survival rates is projected to occur at older ages, since mortality among younger age groups is already very low. Survival rates are expected to rise more for males than for females, continuing an established trend.

Fertility assumptions

Fertility rates by age and county were projected to remain constant at 2000 levels.

In 2000 the Minnesota total fertility rate was 1.97 lifetime births per woman. (See *Population Notes*, May 2002.)

County total fertility rates range from a low of 1.32 in Stevens County to a high of 3.01 in Mahnommen County.

Migration assumptions

Migration rates were assumed to vary by age, sex and county as well as over time.

From 2000 to 2010, fastest growth in Minnesota will be for ages 50 to 64

Source: State Minnesota Demographic Center
Numbers are rounded

Projected % change in population 85+ 2000 to 2010

Source: Minnesota State Demographic Center

In-migration and out-migration were projected separately. Net migration was calculated by subtracting out-migration from in-migration.

Data on in- and out-migration from the 2000 census was not available at the time these projections were prepared. In the absence of recent data, migration numbers from the 1990 census were updated using an estimate of total county migration between 1995 and 2000. Migration from 1995 to 2000 was estimated by cutting in half the residual method estimate of total county migration from 1990 to 2000. (See *Population Notes*, July 2002.) The 1985 to 1990 in- and out-migration figures by age and gender were updated to 1995 to 2000 using an adjustment procedure described by Smith, Tayman and Swanson in their 2001 publication *State and Local Population Projections*.

This method assumes the age profile of in- and out-migrants remained the same in 1995 to 2000 as in 1985 to 1990, though the numbers differ.

Once the adjusted numbers of in- and out-migrants were estimated, new in- and out-migration rates were

calculated. The in-migration rate for each county was based on dividing the number of in-migrants by the total 1995 U.S. population in that age-sex group minus the age-sex group population in the county. The U.S. population estimates come from the U.S. Bureau of the Census at <http://eire.census.gov/popest/archives/national/nation2/intfile2-1.txt>

The out-migration rate was based on dividing the number of out-migrants in each age and sex group by the county population in the comparable age and gender category. The 1995 age-sex population estimates by county come from *Faces of the Future* (Minnesota Planning, September 1998.)

The procedures used to obtain in- and out-migration rates for counties were also used to calculate rates for the state.

For projections of future migration, the out-migrant pool was the 2000 census population or the projected population of the state or county in the age-gender group. The in-migrant pool was the

projected national population by age and gender from the U.S. Census Bureau Middle Series 1998 projections, minus the state or county population. The numbers in the 1998 national projections were increased based on the ratio of the 2000 census counts to projected 2000 numbers.

Migration played an important and unprecedented role in Minnesota's population growth between 1990 and 2000. Strong job growth and an extremely low unemployment rate attracted many new residents to the state. Though the projections anticipate solid economic performance in the future, the difference between Minnesota and its competitors is unlikely to continue at the same magnitude for the next 30 years. In the projections, future in-migration rates for Minnesota were reduced and out-migration rates were increased. In-migration was reduced by multiplying the following values times the 1995-2000 rate: 2000-05, .99; 2005-10, .93; 2010-15, .88, 2015-20 .84; 2020-25: .81;

From 2000 to 2030, fastest growth in Minnesota will be for ages over 60

Source: Minnesota State Demographic Center

Sources: 2000 census, SF1; Minnesota State Demographic Center
Numbers are rounded

2025-30, .80. Out-migration rates were increased by the following ratios during these same periods: 1.005, 1.015, 1.025, 1.05, 1.05, 1.05.

Counties were divided into three categories. Counties that demonstrated a pattern of faster-than-average growth and grew faster from 1990 to 2000 than in earlier decades were treated in a manner that would give them a greater share of the state's migration-related growth in the future.

The first group of seven counties (Aitkin, Carver, Cass, Cook, Crow Wing, Pine and Scott) grew faster than the state average and showed a pattern of rapidly accelerating growth, with annual growth during the 1990s occurring at a rate at least 1.0 percent faster than the average from 1970 to 1990. For these counties, in-migration rates from 1995 to 2000 were multiplied by 1.03 and kept constant in each time period. Out-migration rates from 1995 to 2000 were multiplied by .98 and also kept constant.

The second group of 13 counties (Beltrami, Chisago, Dodge, Douglas, Hubbard,

Kanabec, Mille Lacs, Olmsted, Otter Tail, Rice, Sherburne, Stearns and Washington) also grew faster than the state average from 1990 to 2000 and showed a pattern of moderately accelerating growth. Their annual growth rate during the 1990s was between 0.1 and 0.9 percent faster than the annual average between 1970 and 1990. In- and out-migration rates in these counties were kept constant at 1995 to 2000 levels.

For the remaining 67 counties, in-migration rates were decreased and out-migration rates were increased over time. In-migration rates were reduced by multiplying the 1995 to 2000 rates times the following: 2000-05, .981; 2005-2010, .97; 2010-15, .935; 2015-20, .91; 2020-25, .885; and 2025-30, .88. Out-migration rates were increased by the following amounts in the successive time periods: 1.0026, 1.0055, 1.009, 1.015, 1.023, 1.034. These rates were selected because they produced numbers that added up to values close to the previously calculated state totals, thus minimizing the amount of controlling that had to be done.

Net in-migration for Swift and Pine counties was reduced, with zero total net migration assumed overall for 1995 to 2000. These counties contain prisons, and in-migration of inmates appears to have been responsible for much of the in-migration in the 1990s. In the projections, the male population 20 to 54 in these two counties was calculated by adding the 2000 difference between male and female populations by age to the projected female population in those age groups.

For the state and all counties, in- and out-migration rates by gender were averaged for children age 0 to 14. Since children generally move with their parents, any gender differences in the migration data can be assumed to be random. Rates by gender were also averaged for age 75 and over in all counties except Hennepin and Ramsey because of the relatively small size of these age groups and the small amount of migration.
