

August 2009

This *MetroStats* covers trends in new housing construction in the Twin Cities region during 2008 in the context of longer-range construction trends. Analysis is based on building permit authorizations by each local jurisdiction, collected annually by the Metropolitan Council from local officials.

Another data source, the U.S. Census Bureau, is also used to track building permits on a preliminary basis. Metropolitan Council verifies its data with local officials as needed to assure data quality. It can thus be considered the most accurate available and is used to calculate the Council's annual household and population estimates. The Council's data also enumerate townhouses separately, whereas Census data include these in the single-family category. Data are subject to revision for a year, but substantial revisions are not anticipated.

General trends shown by the two data sources are similar with Metropolitan Council data typically picking up a somewhat higher housing unit count. For 2008, the Council's survey showed 760 more housing units, a difference of 17 percent.

Highlights

New housing construction sunk to a historic low in 2008 with just 5,051 new housing units permitted. Annual construction levels were more than four times higher during the peak years earlier this decade.

The region enjoyed a stronger pace of construction earlier in the decade than other large metropolitan areas outside the coastal and sun-belt areas, on a percapita basis. Growth also continued here a little longer but saw a more dramatic reversal in recent years, compared to other large metros. (For more information see *MetroStats: Residential Construction in the Twin Cities Region, 2008 Preliminary*, from March 2009.)

This decade's growth averaged approximately 15,900 new housing units annually, climbing from the 15,100 units annually during the 1990s. In the longer-range context, these levels were below the scale experienced in the 1970s and 1980s when Baby Boomers were forming new households and expanding the pool of first-time homebuyers.

Townhouse and multifamily construction surged this decade to 57 percent of new housing units permitted (nearly 81,000 units). Their prevalence as a housing option can be seen increasingly in the region's newer-developing areas as well as in the region's core areas.

Housing units permitted annually, 1970-2008

New Housing Construction Permits in the Twin Cities, 2008

August 2009

Permits Issued in 2008

After the economic downturn in 2001, the region's new housing permits climbed each year to a peak in 2004 with 21,355 housing units authorized. Permit totals have dropped sharply each year since then, falling to 8,526 units for 2007, and dropping another 41 percent between 2007 and 2008, to a total of 5,051 units for the year.

Building permits issued, 2008

Top 10 Communities Permits, 200	-
Community	# Units
Lakeville	416
Woodbury	342
Maple Grove	322
Minneapolis	279
Edina	273
Blaine	238
Rosemount	237
Hugo	188
St. Paul	160
Plymouth	157

Leading communities within the region were Lakeville (416 units), Woodbury (342) and Maple Grove (322). No other community had permit totals in excess of 300 units. The edge of development continues to move out from the region's center albeit at a slower pace during this economic downturn.

During 2008, developed areas within the region accounted for 27 percent of building permit activity while still-developing areas accounted for 73 percent. Only 5 percent of new housing was going into rural areas. This split between developed and developing areas is consistent with trends of the 1990s and this decade to date. In the 1980s, in comparison, the shares were close to 50/50 with just slightly more of the new housing construction occurring in developing suburbs.

Planning area shares of region's 2008 permits

August 2009

MetroStats

For 2008, single-family detached housing maintained the largest market share at 45 percent of the region's total, followed by larger multifamily buildings with 35 percent. Duplexes, triplexes and quads only represented one percent. Townhouses made up the remaining 19 percent.

Mix of Housing Types, 2000-2008

Although total permits trended upward until 2004 before plunging to 2008's levels, the trends for single-family detached housing and for other housing types were distinctly different. Single-family activity trended downward throughout the decade, with just a slight uptick in 2003. Other housing types, including townhouses, apartments and condos, expanded strongly through 2004. For the overall period 2000 through 2008, 57 percent of all housing units permitted were housing types other than single-family detached. At the start of the decade the percentage was 47 percent, climbing to 64 percent mid-decade. The 2008 share was close to the decade-to-date total at 55 percent.

The Metropolitan Council enumerates new residential structures on the basis of four housing types, since they are associated with different rates of land consumption and average household size. Categorization is on the basis of structural characteristics rather than ownership. For example, the multifamily category includes condos as well as apartments.

The condo boom in the central cities helped to lift permit totals mid-decade, but strong demand for alternatives to detached single-family homes was certainly not only a phenomenon of the region's core areas.

Regional townhouse construction averaged 1,971 and 1,972 units per year during the 1980s and 1990s respectively. During 2000-2008 the average shot up to 3,260 units per year. Developed and developing suburbs had roughly equal shares of townhouse activity during the 1980s (approximately 900 units annually). During the 1990s and in the current decade the volume of new townhouse construction in developed areas edged downward (711 units on average, 2000-08), but in the developing areas it more than doubled to a 2000-08 average of 2,340 per year.

During the 2000-08 period nine communities approved permits in excess of 1,000 new townhouse units. Woodbury led with 1,418 units, followed by Prior Lake, Blaine, Shakopee, Lakeville, Plymouth, Ramsey, Savage, and Eden Prairie.

New Housing Construction Permits in the Twin Cities Region, 2008

August 2009

Multifamily units (condo and rental) were at a strong 6,760 units per year in the 1980s, falling to 3,094 units in the 1980s, and rebounding to 5,734 units this decade. Averages for 2000-2008 were 1,548 in the central cities, 1,521 in developed suburbs, and a significantly higher 2,604 units in the developing suburbs.

Minneapolis and St. Paul chalked up 8,857 multifamily units and 5,076 multifamily units respectively. Top suburban locations were nearly all still-developing suburbs. Cities with multifamily totals ranging from 2,476 down to 1,504 units were, in descending order, Maple Grove, Plymouth, St. Louis Park, Apple Valley, Eden Prairie, Inver Grove Heights and Lakeville.

The two charts below show single-family and multifamily trends over the decade with large proportions of the region's growth occurring in the developing suburbs. The multifamily chart illustrates permit activity falling off noticeably beginning in 2005, but blunted somewhat by an uptick in construction levels in the central cities.

Central cities 8,000 Developed suburbs 7,000 Developing suburbs Rural 6.000 5.000 4.000 3.000 2.000 1,000 0 2000 01 02 03 04 05 06 07 08

Multifamily/townhouse units permitted, 2000-2008

Multifamily and townhouse construction has taken the highest percentage of market share within the central cities, compared to elsewhere in the region. It has accounted for over half of the construction total in the developed suburbs since the 1970s and gained especially during this decade, growing to a 74 percent share. In the currently developing suburbs, only a third of new housing was multifamily/townhouses in the 1970s, but that proportion has climbed to over half (53 percent) this decade. Even in the rural areas of the region, these housing types have stepped up to a 12 percent share over the decade and 17 percent in 2008.

Examples of this shift include Hugo (5 percent in the 1980s, 15 percent in the 1990s, and 63 percent this decade); Ramsey (3 percent, 6 percent, 61 percent); and Savage (16 percent, 16 percent, 63 percent).

Multifamily/townhouse permits as percent of total permits, by decade

August 2009

MetroStats

Multifamily/Townhouse Percent of Permits

This set of maps illustrates the changing distribution and prevalence of townhouse/multifamily units over time. These housing types have remained somewhat more concentrated among top permit-issuing cities, compared to overall housing growth. In the 1980s, the top 10 multifamily/townhouse communities accounted for 55 percent of the region's total, while the top 10 permit issuers overall accounted for 44 percent. During the 1990s and this decade, the top townhouse/ multifamily hot spots made up just under half of the region's total, and the top communities in total permits made up just under 40 percent.

The maps show an increasingly larger area of the more intense levels of development, as well as an increasing emergence of these housing types, in areas further from the region's core.

Historic downtown revitalization in Rosemount: Waterford Commons with 108 rental apartments and 13,000 square feet street-level commercial space.

Senior housing projects boost Lakeville to the region's #1 city in housing permits during 2008. Left: Highview Hills, "continuum of care" includes independent living apartments and assisted living (155 units total). Also, the Crossroads Senior Housing project, an initiative of the Dakota County Community Development Agency, will add 87 affordable units for seniors.

New Housing Construction Permits in the Twin Cities Region, 2008

August 2009

Overall Housing Growth

The following map series depicts the changing pattern of development intensity over time in terms of total housing units authorized per decade.

Minneapolis and St. Paul led the region in housing construction during the 1980s due to their continuing multifamily development. There was a pronounced weighting toward the region's western side, with the highest numbers of new units going to second-tier suburbs. Starting with the 1990s, growth began to increase in developing suburbs to the south, west, and north; and continued to increase in areas at greater distances from the region's center.

Apart from Minneapolis and St. Paul, leading communities in the 1980s were Eagan, Plymouth, and Eden Prairie. During the 1990s, top growth areas were Woodbury, Eagan, and Plymouth. From 2000 through 2008, leaders were Woodbury, Maple Grove, and Lakeville.
