MINNESOTA LAKES

Bulletin No. 25

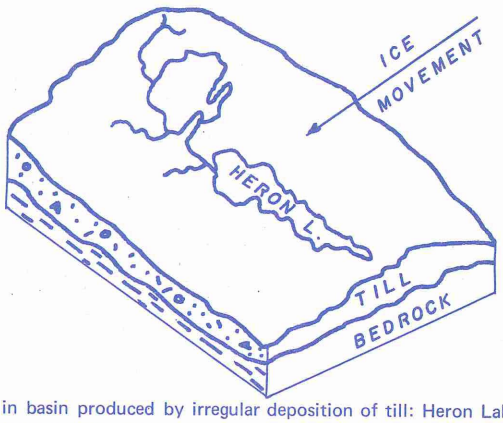

LEGISLATIVE REFERENCE LIBRARY
645 State Office Building
Saint Paul, Minnesota 55155

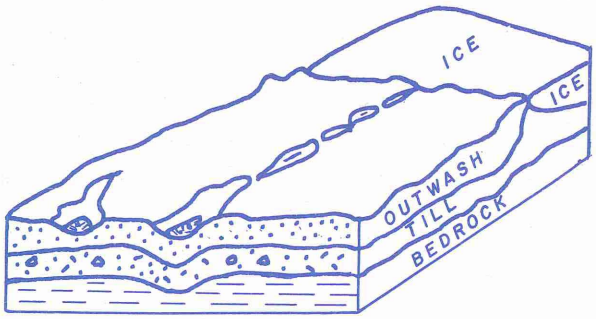

Types of Lake Basins

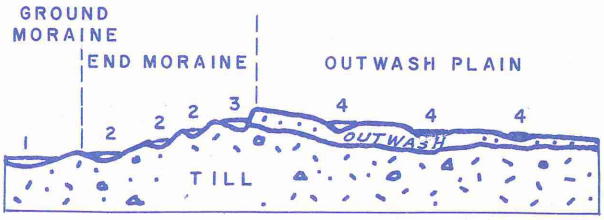

Moraine-dam lake: Mille Lacs Lake and Mille Lacs moraine.

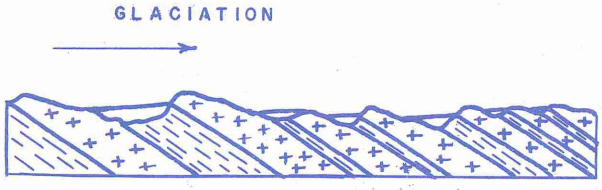

Lake in basin produced by irregular deposition of till: Heron Lake in northwestern Jackson County.

Lakes in ice-block basins in till localized by preglacial valley.

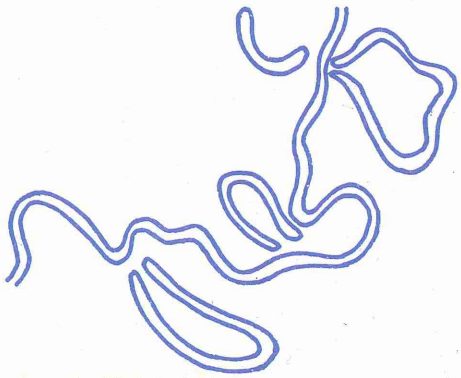

Lakes related to glacial deposition: 1) basin formed by irregular deposition of till, 2) ice-block basins in till, 3) ice-block basin in till and outwash, 4) ice-block basins in outwash plain. (After Zumberge, 1952.)

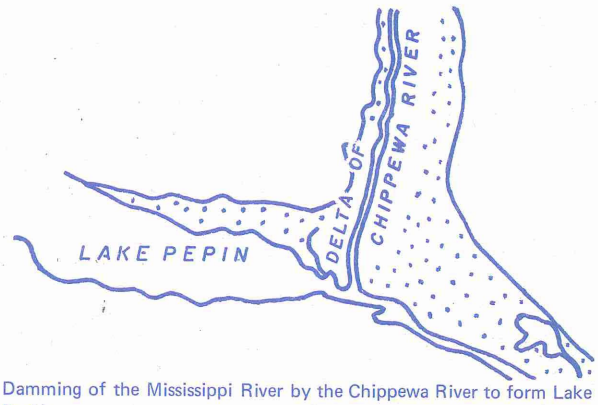

Lake basins in bedrock valleys in eroded slate.

Lake in bedrock basin not related to preglacial valleys.

Oxbow lakes along the Mississippi River in Aitkin County. These are abandoned meander loops of the river.

Damming of the Mississippi River by the Chippewa River to form Lake Pepin.

AN INVENTORY OF MINNESOTA LAKES

In this report all lakes, 10 acres or more in area, are listed. It includes the lakes along the borders of the state which are partly in Minnesota and partly in adjoining states or Canada. Reservoirs and artificial impoundments for improvement of wildlife habitat and for other recreational purposes are also included.

Names

It is not unusual to find two or more names applied to the same lake on different maps. Variations in spelling are also not uncommon. In determining the names to be used in this publication, official names and spellings established by decisions of the U.S. Board on Geographic Names or of the Minnesota Geographic Board have been used wherever such decisions have been made. In other cases, all reliable sources of information such as maps, official documents and historical publications have been consulted. Where multiple names occur, the official or selected name only is used in the county lists. Alternate names are however included in the alphabetical list at the end of the volume.

Numbers

For identification and data processing purposes every lake in the list has been assigned a number. The first part of this number identifies the county. A lake in more than one county is assigned a number in the county which contains the largest part of the lake. Its name also appears, with the same identification number, in the lists for the other counties involved. In the summaries showing the total number of lakes the lake is counted only in the county in which it is numbered.

Determination of Areas

Most of the lake areas were obtained by measurements made of aerial photographs. Table 1 lists the dates of aerial photographs used in determining lake areas. In a few instances aerial photos were not available for portions of counties. In these counties U.S. Geological Survey topographic maps and U.S. Forest Service and other planimetric maps were used. Lake areas were checked by reference to topographic maps throughout the state, even when aerial photographs were available.
Some of the aerial photographs used in preparing these quadrangle maps are on file with the Division of Waters, Soils and Minerals.

Areas of federal reservoirs were obtained from records of the U.S. Corps of Engineers. Areas of lakes on the Canada-Minnesota border were obtained by planimetering charts of Minnesota-Ontario border lakes, prepared by the U.S. Lake Survey in 1945 and 1950.

Meandered Lakes

The meandered area of a lake includes all the portion of property lying within the meander lines shown on plats made by the United States General Land Office. A meander line is a series of courses and distances to delineate the area of a body of water. It is not a boundary line but may be considered to be the limit of taxation. It did enable the General Land Office to plot fractional sections and compute their areas. The instructions governing the Land Office survey stated that all lakes, ponds and bayous with an area of 25 acres or more were to be meandered, but this policy was varied at the discretion of the surveyors. The Gazetteer of Meandered Lakes of Minnesota, published in 1928 by the State Department of Drainage and Waters, listed 4,480 meandered lakes in Minnesota, including meandered boundary waters. This list was completed from the original township plats prepared by the United States General Land Office. .

What Is a Lake?

An enclosed basin filled or partly filled with water may be defined as a lake. The lake may have inlets and an outlet stream, it may have only an inlet or outlet, or it may be completely enclosed.

All lakes have a natural fluctuation in water levels. Some lakes in completely enclosed basins with intermittent surface water inflow and little ground water inflow fluctuate through great ranges in levels from very low to extremely high. Other lakes located in basins which have perennial streams as inlets and outlets may fluctuate within a narrow range. Lakes which receive a major portion of their water supply from ground water springs and seeps will generally have fairly uniform levels as long as the ground water supply to the basin remains somewhat constant.

Many of Minnesota's lakes have been drained or partly drained by the construction of artificial ditches or by the deepening of natural channels. To make this inventory complete all such lake basins have been included wherever they can be positively identified. They are described in the county lists as "affected by" a ditch, or "bed exposed" as the actual extent of drainage or the cause of extremely low lake levels is not always known with certainty. Lakes, for the purposes of this inventory, include all natural enclosed depressions, 10 acres or more in area, which have substantial banks capable of containing water and which are discernible on aerial photographs. The inventory also includes all bodies of water, except streams, which are shown within the meander lines on plats of the General Land Office surveys.

Lakes are constantly undergoing changes in size, depth, and shape. The rate and type of change in a given lake is dependent upon several factors including: the climatic and topographic conditions; the nature of the soil or rock materials which underlie the lake basin and cover the basin watershed; the biological environment; the physical configuration of the basin; and the nature and extent of artificial and natural drainage within the watershed of the lake.

Factors Affecting Lakes

Climate and topography

The ultimate source of the water necessary to fill basins and create lakes is precipitation. Much of the precipitation which falls on the land and water surfaces is lost through evaporation and transpiration and is returned to the atmosphere. Some of the rain, melted snow and ice infiltrates the ground to replenish the underground water supply which may discharge into the lake basin when ground water levels are sufficiently high. The remainder moves laterally along the land surface and drains into the basins or streams.

Each natural lake basin has a catchment area or watershed. The amount of surface runoff which will be available to a lake depends on the size and topography of the watershed and the amount of precipitation falling on it. Steep watershed slopes accelerate runoff and reduce the amount of water available to recharge ground water reservoirs. The ratio of lake basin area to watershed area is a major factor affecting the water supply available to a lake.

The annual precipitation over the entire State of Minnesota averages 25 inches. This is the lowest annual rainfall of any of the states bordering the Mississippi River and is less than the average annual precipitation in 38 of the 50 states. Fortunately, about a half of the year's total rainfall occurs during May to August. This, combined with lower evaporation rates due to the generally moderate summer temperatures of most of the state, accounts for the fact that Minnesota's lakes usually have ample water supplies. Supplemental supplies of water are available from the generally adequate ground water supplies of most lake areas of Minnesota.

The climate and topography of the state vary greatly. Annual precipitation increases rather uniformly from 19 to 20 inches in the northwest corner of the state to 32 inches in the southeast.

Topography varies from 602 feet above sea level along Lake Superior to 2,301 feet at Eagle Mountain in Cook County; both areas are in northeastern Minnesota. Most of the state, however, may be considered as a low plateau at the head of the Mississippi River with an elevation of about 1,200 feet above sea level. In addition to the rocky ridges along Lake Superior, high areas exist near the headwaters of the Mississippi River in the north-central part of the state and in the southwestern corner where elevations approach 2,000 feet. Low areas are found along the Mississippi River and the Red River of the North. A large area in east-central Minnesota, including the Twin Cities area, is mostly below 1,000 feet.

The state can be divided into six major physiographic provinces on the basis of climate and topography.

The Arrowhead region has many lake basins and is predominantly rocky with steep slopes. Average annual precipitation ranges from about 24 inches to about 29 inches, annual runoff is 8 inches to 10 inches, and evaporation rates are low.

The Central Lake region has an abundance of lakes. Topography is variable but much of the region is hilly. Precipitation averages 22 to 24 inches annually and runoff averages 4 to 6 inches per year.

The Northwest has generally flat slopes and contains few natural lake basins. Precipitation and runoff are normally low, but when heavy spring rains and rapid snowmelt occur, floods often result.

The Central region has varying topography. It is not as hilly as the lake region but has good precipitation and fair runoff. The area contains quite a few lake basins, but some contain only small amounts of water.

The Southwest has low rainfall and low runoff. Much of the region is devoid of lakes although there are many small shallow lake basins which hold water during the spring of the year and for short periods of time after heavy summer rains. Evaporation is usually high in the area.

The Southeast has the highest average annual rainfall in the state. The land is predominantly steeply sloping and runoff is about 6 to 8 inches per year. The area is only lightly glaciated and contains few lakes.

Soil and Rock Materials

Bedrock basins formed in predominantly rocky terrain are often deep and are generally long lived. They receive little sedimentation and the banks forming the basin are usually resistant to erosion. As a result, the depths and shapes of these lakes remain relatively unchanged over long periods of time.

Basins formed in predominantly silty and clayey terrain may be shallow and the surrounding watershed is often poorly drained and marshy. "Perched lakes" are found frequently in relatively impervious materials that receive little or no recharge from ground water supplies.

Basins formed in sandy and gravelly terrain are often fairly deep. The lakes in these areas have a constant interchange between surface and ground water due to the high permeability of the sandy soils and are rarely dry except during periods of prolonged drouth.

Biological Environment

Dr. John B. Moyle of the Division of Game and Fish, Minnesota Conservation Department, has divided the lakes of Minnesota into several general groups based on carbonate hardness of the lake waters. Water from lakes in Precambrian bedrock has hardness values of less than 40 parts per million. Water from lakes in hilly glaciated regions of central, northern, and western Minnesota has a carbonate hardness content ranging from 40 to 200 parts per million. Water from lakes in shallow basins in southern Minnesota, south and west of the Minnesota River and in the bed of Glacial Lake Agassiz in western Minnesota has calcium carbonate concentrations as high as 225 parts per million due to the calcareous nature of the glacial drift found uniformly throughout this area.

A chief chemical deposit in lakes is marl, a soft earthy material consisting mainly of calcium carbonate. Calcium carbonate is derived from the soil and rock materials at and below the surface and is carried into the basin primarily in solution in the ground water which discharges into the basin. As this carbonate precipitates out of the water in the basin, marl forms and may accumulate to great thicknesses partly filling the basins.

Rapid changes in lake character may occur as a result of the accumulation of organic sediments. Minute plants and animals can accumulate in the bottom of a lake in the form of "sludge", a black organic ooze. A mixture of "sludge" and calcium carbonate forms muck, which can be found in many shallow lakes in Minnesota. The decay of organic materials greatly increases the fertility of lake waters which become rich in nutrients and promote rapid growth of vegetation, especially along the margins of a lake. The accelerated growth of the vegetation decreases the areal extent of the lake by filling in the shallow areas and increases water loss through transpiration.

As a lake becomes shallower, a succession of different plants begins around the lake margin. The cycle of vegetative growth, decay, and replacement by a new succession fills the lake basin with accumulated organic debris. Eventually the basin may become filled with this material and all traces of the former lake basin disappear. The rate of growth and advance of the plant succession is controlled by climatic conditions, soils, and

water levels in the lakes. Very shallow lakes, having restricted surface and ground water inflow, may rapidly fill with organic materials, but deeper lakes which undergo periodic fluctuations in water levels may not become filled for many years.

Another type of plant succession may occur during the late stages of vegetative encroachment on a lake when the decayed materials at the lake margin form a bog. A floating sedge mat may grow out from this bog over the remaining open water surface. This floating mat eventually covers the entire lake and becomes a quaking bog that gradually becomes thicker. In time the sedge mat is succeeded by willows or swamp conifers and finally by swamp hardwood trees.

Physical Configuration of the Basin

Some of the factors involving the size, depth, and shape of the basin have been covered in the discussion of other processes affecting changes in lakes. Small shallow saucer-shaped basins will generally fill with sediment faster and will lose water more rapidly through evaporation. Deeper basins will not undergo changes as rapidly and will generally remain water-filled for longer periods of time. Narrow elongated basins are usually located in stream valleys and water levels within these basins are generally maintained by the streams passing through them. Large basins often undergo changes in shape and size due to the action of wind and ice.

Natural and Artificial Drainage

The surface and underground drainage of the watershed area surrounding a lake affects its supply of water. Natural drainage within a basin watershed may be highly developed so that practically all of the water falling on the land surface runs off into well integrated streams which carry the water into and away from the lake. Artificial drainage systems consisting of open ditches and subsurface tile drains have been constructed in many parts of the state. Of the 15,291 lake basins in Minnesota there are 3,257 which are classified as partly or completely dry. (See table 2.) About 90 percent of these are affected to some extent by artificial drainage systems. Some systems are directly connected to the basin itself; others divert water from the natural watershed and cause lowering of water levels in the lake by decreasing the amount of runoff which would be available to sustain the lake under natural conditions. Tile drains and some large deep ditch systems may lower shallow ground water levels in local areas and result in additional water loss from lakes. Some lakes are located in basins consisting of glacial materials which are very permeable. The lakes will generally have satisfactory levels of standing water as long as the water table is near the land surface, but as ground water levels recede during the dry periods of mid-summer, the levels of the lakes will recede as a result of lowering of the ground water table and from increased evaporation of the water from the lake surface.

Supplementing the water supply of lakes by pumping from wells can be a successful operation, depending on the size of the lake, local climatic conditions, the nature of the lake basin materials, the availability of adequate ground water supplies, and the cost of constructing, maintaining and operating the system.

Origin of Lake Basins

The discussion of the origin of lake basins, in each county section, is based on information contained in Minnesota Geological Survey Bulletin 35, "The Lakes of Minnesota – Their Origin and Classification," by James H. Zumberge. As most of the basins were formed by geologic processes, the classification involves geologic terminology. The glossary on page 24 explains the geologic terms used.

General Geologic History

The present topography of Minnesota reflects a unique glacial history that probably represents the most complex occurrence of glaciation in the entire world. It is primarily the result of the invasion by four continental ice sheets which advanced and retreated across the state from at least three different directions during the Pleistocene age.

Throughout the ice age a wide variety of surface

depressions was created by glacial erosion and deposition. Many of these depressions now constitute Minnesota's thousands of lakes, most of which were formed by the youngest ice sheet that occurred approximately 10,000 years ago.

As the ice sheets moved across the land they picked up and carried everything from huge boulders to fine dust. In the elevated rocky regions of the northeast the glaciers scoured and striated the rocks and actually plucked huge blocks out of the softer rock formations. Many of the rocky lake basins near the Canadian border were formed in this manner. The excavated material was gradually broken down by the glacier into a debris of soil and rock called "drift" which was transported to other areas. Climatic changes caused the glaciers to melt and recede northward, and the drift was deposited in various land forms. The drift near the base of the ice formed gently rolling ground moraine which covers most of the southern part of the state. In other regions, where the ice terminated, the drift was piled up at the edges of the glacier to form moraines or belts of hills of varying size and shape. Some of the drift material was deposited in preglacial stream valleys or filled depressions left by previous glaciers.

At times the frontal margins of the glaciers remained stationary and meltwater flowing from glacial streams re-sorted the drift into sand and gravel deposits which often merged together, forming smooth outwash plains. In many areas isolated blocks of ice were buried in the outwash plains, and as the ice melted, it left depressions or pits which later filled with water and became lakes. Areas of outwash containing many ice block basins are called pitted outwash plains. The outwash deposits of sand and gravel often were covered with glacial material deposited by later overriding ice sheets or by deposits which accumulated during warmer periods between glacial advances.

The melting glaciers released large quantities of water which filled low basins forming at least six temporary glacial lakes in Minnesota. Lake Agassiz, the largest of the glacial lakes, was formed as a glacier retreated northward from the divide between Traverse and Big Stone Lakes along the boundary between South Dakota and Minnesota. As the glacier receded farther north, the lake formed by its meltwater expanded until it filled large areas in the Dakotas, northwestern Minnesota, and Canada. Many old beaches mark the successive lowering of the lake level as the ice gradually retreated. The initial outflow from Lake Agassiz flowed southeastward eroding the wide, deep valley of glacial River Warren which is today the valley of our present Minnesota River. In the final phase, all support by the receding ice front was lost, and a new outlet to Lake Agassiz was found towards Hudsons Bay along the present course of the Red River of the North. After Lake Agassiz was completely drained, it left the present flat lake plain surface which is typical of northwestern Minnesota. Lake clays and silts and recessional beach ridges are now the only remnant features giving evidence of this ancient body of water.

Classifications of Lake Basins

There are four major categories used in classifying lake basins in Zumberge's report. Examples of most of the types of basins discussed in this section may be found in the individual county histories accompanying the maps and tables.

I. Basins formed by geologic processes.
   A. Basins produced by glacial deposition.
      1. Irregular deposition of till. Basins formed in this manner are located in natural depressions and consist of material deposited directly by the glacial ice as it moved across the land. Most of these basins are shallow, especially in areas of ground moraine topography.
      2. Moraine dam basins. These basins are formed by the damming action of a morainal ridge which ponds water in regions where the land surface slopes toward the moraine.
      3. Ice block basins. There are many of these in Minnesota. They were formed from stagnant blocks of ice which remained partly buried in glacial debris after glaciers retreated. Six different classes of ice block basins are based on the nature of the glacial materials and the manner in which the ice blocks were deposited.
         a. Ice block basins in till. These basins were formed by the melting of ice blocks deposited in till, followed by the collapse of the overlying material. They are usually surrounded by hills and knolls, with steep slopes towards the lake basin where the ice collapse occurred.
         b. Ice block basins in till located along preglacial valleys. These basins are recognizable by the pronounced alignment of a series of basins forming a pattern that may extend for many miles. In many instances the basins are not aligned with the existing drainage and they may cross present stream valleys.

The ice blocks forming these basins accumulated in preglacial valleys that were partly buried by a later re-advance of ice or by debris accumulating from the downward melting of ice.

c. Ice block basins in outwash plains. This type of lake basin was formed where isolated ice blocks were buried by sand and gravel outwash deposits which later collapsed, leaving a steep sided basin surrounded by level terrain. In areas of extensive outwash deposits there may be many of these partly buried ice blocks and the region is called a pitted outwash plain. The pits are commonly circular or elliptical in shape but this is the result of wind and wave action and is not primarily due to the shape of the ice block.

d. Ice block basins in outwash located along preglacial valleys. These basins are similar to the basins produced by ice blocks in till along preglacial valleys except that they are found in the stratified sand and gravel deposits.

e. Esker trough basins. These basins are usually elongated and parallel to the adjacent esker. It is believed they were formed by buried lenses of ice deposited within the channel of the stream which formed the esker. There are probably many more esker trough basins in Minnesota than are noted in this report.

f. Ice block basins in till and outwash. These basins are formed when ice blocks are deposited along the margin between an outwash plain and till deposits of an end moraine where a part of the ice sheet separated from the main glacial mass. The basin can be distinguished by the steep ice contact slope along that part of the rim of the depression which faces the flat outwash terrain, in contrast to the opposite side, which displays a more rugged moraine topography.

B. Basins produced by glacial erosion.

1. Bedrock basins. These basins were formed by the erosive action of the glacial ice sheets, many of them in regions where the bedrock is elevated. The basin produced by the scouring action of the glaciers is often the result of differential erosion of the bedrock surface by the large rocks at the front and base of the ice sheets. The harder, more resistant bedrock remained as ridges and the softer bedrock was gouged and plucked out along joint planes and fault lines as the glacier moved across the land.

2. Bedrock basins located along preglacial valleys. These are basins produced by the scouring erosive action of the ice sheet along preglacial drainageways which were controlled by the bedrock structure. Some of these basins are located along joints and fissures in the bedrock which were enlarged by glacial action. Many basins of this type are located along preglacial valleys which were oriented at angles favorable to concentrated erosion by the ice.

C. Basins produced by glacial erosion and glacial deposition.

Basins formed by these two processes are essentially bedrock basins in which the basin capacities have been increased by the deposition of glacial materials which form a dam across the basin rim and enlarge the closure of the basin.

II. Lake basins formed by stream processes.

A. Basins produced by stream deposition.

1. Flood plain basins. These include the depressions located along river valleys which form as a result of aggradation of the materials of the valley by flood waters. Most of these basins are short lived and are shallow. Another type of flood plain basin is related to natural levees which are built up along the stream valley as material is deposited by floods. The levee acts as a type of dam which impounds flood water in the low areas behind it.

2. Basins produced by damming action of streams. These basins are formed along stream valleys when one major stream or its tributary deposits sediment across another stream to form an alluvial fan which, when sufficiently enlarged, ponds water behind it and restricts streamflow.

3. Basins produced by deltas. These are similar to the larger basins produced by alluvial dams except that they are located in isolated areas along minor channels of the main stream which flow across the alluvial delta.

B. Basins produced by stream erosion and stream deposition.

These include the basins which mark

the position of former channels of a meandering stream. Oxbow lakes, which are remnants of meander loops of a stream that has been closed off by alluvial deposition at the ends of the loops, are the most common type.

III. Basins formed by the modification of larger basins. These include all basins that were once part of a large basin but were separated from it by sand bars and spits formed by the action of wind, waves, and ice and by vegetative growth.

IV. Basins formed by minor geologic processes and by artificial means. These basins include those formed by the chemical action of ground water on carbonate rocks which may cause collapse of underground formations creating "sinkholes." "Sinkholes" are closed depressions formed by collapse of the roofs of caves in carbonate rocks when these rocks are located near the surface.

Another type of basin is produced by "blowouts" which are usually shallow depressions in fine sandy materials created by wind action. Neither of these two types of basins are common in Minnesota although a few basins formed by these minor geologic processes may be present.

Basins produced by artificial means include those formed by the construction of impoundments across streams and by the excavation of materials during various mining activities to form open pits which store both surface and underground waters.

Fish and Wildlife

Minnesota's lakes are of many ecological types and no two lakes are exactly alike. Some are best suited to fish, some to waterfowl, and some to wild rice and other aquatic life but all provide scenic and recreational values.

The suitability of a certain lake for fish, waterfowl or wild rice depends upon the size, shape and depth of the lake and the chemistry and basic fertility of the lake water. Many lakes of the northeast have soft, clear water and are much less productive of fish and wildlife than are the fertile waters of the prairie country. Each lake has particular kinds of plants and animals and recreational uses to which it is best suited and because of this, those who use and enjoy our waters have many recreational choices.

There are four major types of game fish lakes, each characterized by a particular society of fishes. Lake trout lakes, most of which are in the northeast, are deep, rock-shored, clear and cold, and are well suited to trout and such associated fishes as tullibee. These lakes provide quality fishing but total yield of trout to the angler is quite low. The best walleye lakes are typically large, have extensive shoal areas of sand and gravel and wide expanses of water usually less than 50 feet deep. Here the walleye is often associated with northern pike and sometimes with muskellunge. The big lakes of the Mississippi headwaters are of this type. The bass-panfish-walleye lakes are usually smaller than the typical walleye lakes, often between 1,000 and 5,000 acres in size, and in addition to large expanses of open wind-swept water, have weedy bays and shorelines well suited to nest-spawning bass, sunfishes and crappies. They are typically hard (high in carbonates) fertile waters and are especially common in the north-central and west-central parts of the state. The fourth common lake type, the bass-panfish lake, is a smaller, highly productive lake with weedy shorelines that produces an abundance of panfishes and large-mouth bass. Usually there are also northern pike.

There are, in addition, many shallower lakes, especially in southern Minnesota that supply much bullhead and crappie fishing but are subject to occasional freeze outs. Thousands of shallow, weedy waters are used by breeding and migrating waterfowl. In the north, many small, deep lakes are suitable for trout management and have been reclaimed by removing stunted, unwanted species of fish which offered little or no sport fishing.

Minnesota also has the largest number of wild rice lakes in the nation. Wild rice is only found in those lakes and streams having a delicate balance between waterflow, water levels, and water quality. These lakes offer the best northern pike fishing in Minnesota primarily because the dense stands of wild rice protect the young fingerlings and prevent them from devouring one another.

Many kinds of waterbirds frequent Minnesota's lakes – ducks, geese and shorebirds – and in the north the loon, our State bird, can be seen and heard on wilderness waters. The prairie lakes, now mostly in corn country, together with smaller wetlands and potholes, are among the best waterfowl producing areas on the continent. On many northern waters there are beaver and otter and in the evening the canoeist paddling quietly along the shore can see deer, bear and even moose.

Preservation of our lakes, the purity of their water, their watersheds, and their fish and wildlife is most important in this time of an expanding human population and increasingly intensive use of lands and waters. It is a job on which much of the future of Minnesota's important recreational resource depends.

Glossary of Geologic Terms

Glacier ..... A body of ice formed by the accumulation and recrystalization of snow, lying wholly or largely on land, showing evidence of present or former flow.

Glacial Drift..... A general term that includes all materials moved or deposited by ice even though subsequently affected by wind and water.

Till ..... Unsorted and unstratified material deposited directly by a glacier without subsequent movement by wind or water. Materials comprising till may range from clay particles to sand and boulders.

Outwash ..... Sorted and stratified material deposited by streams derived from the melting of a glacier. The material usually consists of sandy gravel and small boulders. Outwash may be deposited by streams issuing from the front or sides of an ice sheet.

Esker..... A ridge of gravelly materials deposited by streams that flowed underneath the ice sheet.

Moraine..... A ridge or series of hills composed of glacial till.

End Moraines or.... Terminal Moraines Ridges of till formed at the end of an ice sheet.

Ground Moraines ... Essentially unridged deposits left in the bed of a glacier.

Ice Contact Slope.. Formed by material supported by ice near the margin of a glacier. When the ice melted, the material slumped forming a slope.

Size of Lakes

Each county history contains a table which lists the lakes by range in size. The following table summarizes the total number of lakes of each size classification for the entire state. The areas used in this tabulation include the part of the basin area in Minnesota as well as the part in adjoining states and Canada. For example, U.S. Lock and Dam No. 9 pool, 28-1, has an area of only 450 acres in Houston County, Minnesota. The total area of the pool, however, is 29,250 acres as 28,800 acres are in Wisconsin and Iowa. This pool consequently is listed among those having an area in the range of 5,000 acres or more in the tabulation.

Lakes classified by area

	Total lake area, acres												
	10 to 25	25 to 50	50 to 75	75 to 100	100 to 125	125 to 150	150 to 200	200 to 500	500 to 1000	1000 to 2500	2500 to 5000	5000 and larger	Total
Number of lakes	4482	3728	1892	1167	765	546	689	1262	400	225	63	62	15,291
Percentage	29.3	24.4	12.4	7.6	5.0	3.6	4.5	8.3	2.6	1.5	0.4	0.4	100

Table 3 lists all natural lakes and reservoirs which have areas of 5,000 acres or more in Minnesota. In addition to these, there are 64 smaller reservoirs and artificial lake basins which have areas of less than 5,000 acres in Minnesota.

Distribution Patterns of Lake Basins

The information contained in this inventory can be applied to many aspects of natural resource management. The discussion of lake basin distribution which follows is presented to illustrate one application of these data.

The abundance of Minnesota's surface waters, and the state's favorable location, has long made it a prominent waterfowling state. Located in the northern end of the Mississippi Flyway, millions of ducks and geese migrate through the state in spring and fall, using the many lakes and wetlands for resting, feeding, and rearing of young.

Minnesota is a duck breeding area, rearing more waterfowl than any of the other states in the Mississippi Flyway. A knowledge of the welfare and abundance of these locally-reared ducks is of considerable importance in the management of this resource.

Early efforts to tally the numbers and kinds of ducks breeding in the state utilized systematic sampling routes which were flown by aircraft in the spring of the year when birds were dispersed on the many smaller water areas. It was known for some time that improved census routes could be selected, but a suitable statewide basis for their selection was not available. A detailed knowledge of location and density of breeding areas was needed to devise a more effective and efficient use of time in conducting censuses.

Fortunately, the recent compilation of lake basins has provided such a basis for selective sampling of breeding areas according to their density. Lake basins in the state have been delineated according to density by township. The resulting distribution pattern of lake basins is shown in Figure 1, where areas having 0-1 basin per township, 2-10, 11-20, and more than 20 per township have been grouped.

Agricultural drainage, however, has converted many lakes to farmland. Thus, the historical density of lake basins in the state has been further revised as shown in Figure 2 to reflect current status. This revision indicates that the number of lakes has declined markedly in the southern portion of the state.

By combining the inventory of lake basins with the records of lake drainage, a sampling pattern has been devised which results in increased precision in estimates of duck numbers in Minnesota.

69-3	Birch - R	7,628	
45-1	Thief - R	7,430	
36-1	Nett	7,369	
56-747	Lida	7,277	
4-130	Bemidji - R	6,920	
77-215	Osakis	6,768	
68-3	Roseau	6,650	
38-738	Garden - R	6,427	Includes areas of 4 large and several small lakes.
18-372	Long	6,178	
6-1	Marsh - R	6,100	
6-152	Big Stone - R	6,028 (11,185s)	
21-83	Miltona	5,924	
19-5	U.S. Lock & Dam no. 2 pool - R	5,910	
34-79	Green	5,821	
78-25	Traverse - R	5,780 (11,600s)	
69-617	Sand Point - R	5,680 (8,890c)	Part of Namakan Reservoir system.
56-239	West Battle	5,672	
79-5	U.S. Lock & Dam no. 4 pool - R	5,660 (13,760w)	Does not include Lake Pepin which is part of pool but listed separately.
79-1	U.S. Lock & Dam no. 5 pool - R	5,650 (12,800w)	
38-817	Crooked	5,581 (10,904c)	
56-141	Rush	5,340	
85-13	U.S. Lock & Dam no. 5A Pool - R	5,140 (7,000w)	Includes 15 smaller lakes.

[1] Figure in parentheses () indicate total area of lake or reservoir if part of it is located in an adjoining state or Canada. Letter following figure indicates that basin is also in: c, Canada; s, South Dakota; w, Wisconsin.

[2] R following lake name indicates reservoir.

AITKIN COUNTY (1)

Number of lakes..... 213
Lake area, acres..... 113,929

The most prominent topographic features in the county are the Mille Lacs morainal areas which form horse shoe pattern through the south half of the county east of the Mississippi River, and the Cromwell moraine along the east edge of the county. Between these two morainal belts is a flat swampy area which represents the former bed of Glacial Lake Aitkin.

The southwestern corner of the county is occupied by part of Mille Lacs Lake 48-2, which is a good example of a moraine-dammed lake.

The lakes in this county are located primarily in the two major morainal areas. Although most of the lakes were formed by ice blocks in till, there are several other different types, as illustrated by the following examples:

Origin	Ident. no.	Name
Ice block basins in till	1-67	Rice
	1-148	White Elk
Ice block basins in till deposited in preglacial valleys	1-96	Dam
	1-89	Long
	1-91	Rabbit
	1-1	Pine
Ice block basins in outwash	1-93	Clear
	1-87	Sugar
Irregular deposition of till	1-159	Farm Island
	1-62	Big Sandy
Oxbow lake formed by meander cutoff from Mississippi River	1-79	Lagoon

The largest lake in the county is Mille Lacs, 48-2, which has an area of 62,680 acres in Aitkin County. However, most of the lake is located in Mille Lacs County where it is numbered in the inventory.

Large lakes entirely within Aitkin County are listed below.

Ident. no.	Name	Area, acres
1-62	Big Sandy	9,380
1-67	Rice	4,422
1-33	Minnewawa	2,451
1-159	Farm Island	2,025

Big Sandy, 1-62, was originally a smaller lake which was converted to a reservoir by the construction of a dam across the Sandy River in 1895. It is one of the six Mississippi Headwaters Reservoirs and is operated by the U.S. Corps of Engineers.

AITKIN COUNTY (1)

ANOKA COUNTY (2)

Number of lakes 143
Lake area, acres 16,168

Much of Anoka County is covered by the Anoka sand plain, a glacial outwash deposit composed of sediments of very fine sand which have been reworked in places by wind action to form dunes and blowouts. This plain contains scattered marshy areas and generally shallow lake basins. Many of the lakes have been completely drained by numerous interconnected artificial drainage systems. Most of the lakes are ice block basins in outwash and are maintained by the high ground water levels in the area.

Several chains of lake basins in the eastern half of the county were formed by ice blocks deposited in outwash along preglacial valleys. One chain extends from the southeast corner of Township 34 North, Range 22 West, to the center of Township 32 North, Range 23 West, and the other from the east-central part of Township 32 North, Range 22 West to the southeast corner of Township 31 North, Range 23 West.

There is a good possibility that some of the small very shallow lakes in the county may have been formed by "blowouts". These are depressions in the sandy areas created by wind action. Bunker, 2-90, may have been formed in this manner.

Large lakes entirely within Anoka County are listed below.

Ident. no.	Name	Area, acres
2-42	Coon	1,507
2-43	Rice	633
2-15	Randeau	594
2-26	Linwood	567
2-91	George	542

ANOKA COUNTY (2)

BECKER COUNTY (3)

Number of lakes 662
Lake area, acres 94,578

Becker County has undergone extensive glaciation. It is covered with a variety of glacial deposits ranging from rugged terminal moraine and associated outwash to flat lake plains formed by glacial Lake Agassiz. Nearly all of the lakes in the county are remnants of ice block basins which filled depressions in glacial till plains, morainal areas, glacial outwash plains or in preglacial stream valleys filled with glacial sediments.

Becker County has 20 lakes 1,000 acres or more in size. The largest of these are:

Ident no.	Name	Area, acres
3-195	Height of Land	3,943

BECKER COUNTY (3)

(WEST PART)

BECKER COUNTY (3)
(EAST PART)

BELTRAMI COUNTY (4)

Number of lakes 346
Lake area, acres 345,965

The northern half of the county is a relatively flat swampy area covered with peat soils, lake clays, silts, and sands deposited in the bed of former Glacial Lake Agassiz. The only uplands in this region are the old, abandoned lake beaches which form narrow, sandy ridges that rise 10' to 15' above the surrounding land. There are few lakes in this region. Red Lake, 4-35, is the largest body of water entirely within the state and has more than 90 percent of its area located within this county. The two interconnected basins of Red Lake are considered to be remnants of Glacial Lake Agassiz.

The southern half of the county is a complex morainal region containing many ice block basins. In the southwestern corner of the county, many of the lake basins were caused by ice blocks buried in outwash plains. They form "kettle" basins having distinctive circular or elliptical outlines.

There are three large reservoirs in Beltrami County, as shown in the following table:

Reservoirs in Beltrami County

Reservoir	Ident. no.	Total area, acres		
Red Lake (Hudson Bay Basin)	4-35	288,800	1931	Dam built by U.S. Office of Indian Affairs.
			1951	Transferred to U.S. Corps of Engineers.
Cass Lake (Mississippi River Basin)	4-30	29,775	1899	Dam built by private lumber company.
			1923	Dam deeded to U.S. Forest Service.
Bemidji Lake (Mississippi River Basin)	4-130	6,920	1907	Hydroelectric power dam built.
			1946	Otter Tail Power Co. acquired dam.

BENTON COUNTY (5)

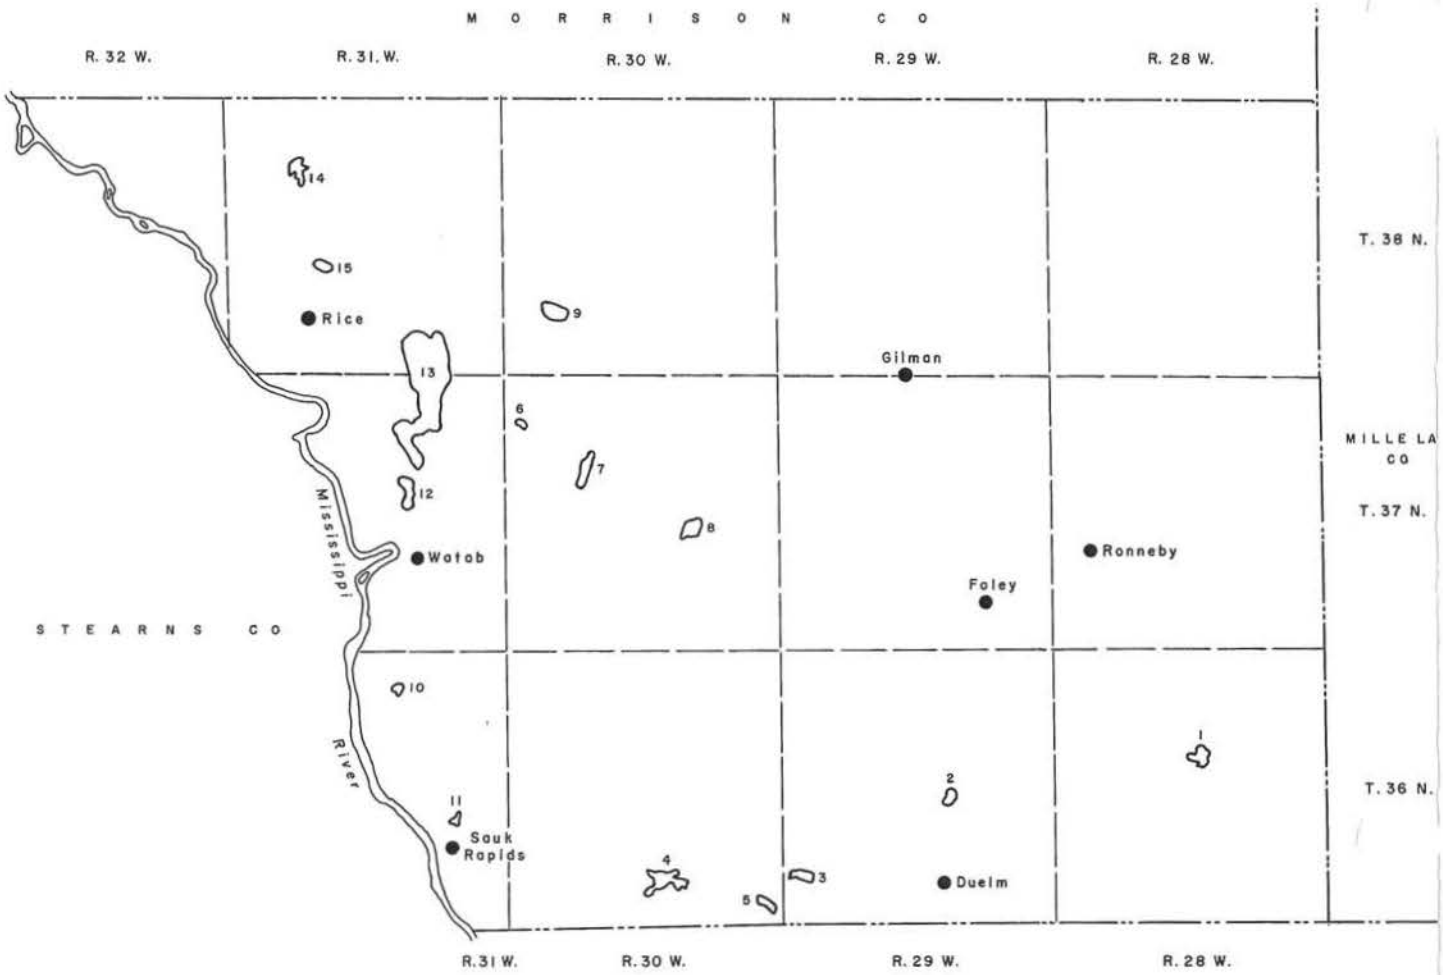

Number of lakes 15
Lake area, acres. 2,067

Benton County has very few lakes. Its surface is composed mainly of gently rolling ground moraine which was deposited by the Pierz ice lobe, which entered this county from the east. The western portion of the county contains outwash deposits associated with glacial drainages along the Mississippi River valley. Granite rock crops out in this locality or is close to the surface. Such terrain is not conducive to the formation of lakes. Little Rock, 5-13, is the largest lake with an area of 1,259 acres.

Lakes classified by area

	Area in acres							
	10 to 25	25 to 50	50 to 75	75 to 100	100 to 125	125 to 150	1000 to 2500	Total

BENTON COUNTY (5)

BIG STONE COUNTY (6)

Number of lakes 195
Lake area, acres. 25,448

Most of the region contains scattered shallow lake basins formed by the uneven deposition of glacial drift in the Big Stone moraine.

Deposition of sediment by the Whetstone River into the Minnesota River valley created a natural dam that eventually led to the formation of Big Stone Lake, 6-152. Marsh, 6-1, was probably formed in a similar manner by an alluvial dam deposited by the Pomme de Terre River. Both of these lakes are now used as reservoirs.

Reservoir	Ident. no.	Total area, acres		History
Big Stone	6-152	11,185	1934-37	Dam built by state to maintain better conservation levels and to reduce downstream flood stages.
Marsh	6-1	6,100	1934	Dam built by state as part of Lac Qui Parle water control project.
			1950	Project transferred to federal government.

BIG STONE COUNTY (6)

BLUE EARTH COUNTY (7)

Number of lakes 133
Lake area, acres. 19,319

Most of the lake basins in the county occupy shallow depressions in glacial till (ground moraine) deposited at the base of a glacial ice sheet of the Des Moines lobe which covered the region. A few of the basins such as the Loon, Mills, Crystal and Lilly chain, 7-96, 7-97, 7-98 and 7-101, originated from ice blocks buried in preglacial valleys.

About 80 percent of the lakes listed in the county are either drained or affected by artificial drainage systems. The county once may have contained many more shallow lakes but all traces of them have disappeared through drainage and sedimentation. The largest lakes entirely within the county are:

Ident. no.	Name	Area, acres
7-44	Madison	1,345
7-60	Eagle	1,183
7-86	Jackson	1,140
7-96	Loon	818

Lura, 7-79, a large lake of 1,263 acres total area, is mostly within Blue Earth County but extends also into Faribault County.

BLUE EARTH COUNTY (7)

BROWN COUNTY (8)

Number of lakes 99
Lake area, acres. 9,951

The surface of Brown County was endowed with only a few shallow lakes. It is composed primarily of shallow ground moraine and several weak recessional moraines associated with the Des Moines ice lobe.

These deposits are cut through in a west-east pattern by old glacial drainage channels that carried meltwater from the receding Des Moines lobe. They often follow the low drift-filled depressions of preglacial stream valleys. Sleepy Eye Creek, Cottonwood River and Little Cottonwood River now follow some of these drainage ways.

Most of the larger lakes in the county were formed where blocks of ice became lodged in the preglacial valleys and buried by alluvium transported by the glacial streams. Hanska, Wood, School, Clear, Gilman and Boys lakes were all formed in this manner. The remainder of the lake basins occupy small kettle holes formed in the shallow drift of the recessional moraines.

Two oxbow basins, 8-25 and 8-71, occupy cut-off meander loops of the Minnesota River in Township 111 North, Ranges 31 and 33 West. The Flandrau Park Pool, 8-6, was developed by construction of a state dam across the Cottonwood River near New Ulm in 1937 and 1938.

Only 20 of the 99 lakes listed in this county are unaffected by artificial drainage systems. The two largest lakes, Hanska, 8-26, which has an area of 1,844 acres, and Emerson, 8-1, which has an area of 715 acres in Brown County and a total area of 1,268 acres, are both partly drained by various ditches.

CARLTON COUNTY (9)

Number of lakes 74
Lake area, acres. 9,142

The lake basins of Carlton County were formed mainly from ice blocks which were deposited in glacial till. Their location in the county corresponds to the general location of the major morainal regions.

A former extension of Lake Superior, Glacial Lake Duluth, once covered much of the northeastern and southeastern parts of the county and this area contains no lakes. Many of the basins in the northwest part of the county were formed from ice blocks deposited in till along preglacial valleys. Some of the basins in the area extending northeastward from the city of Moose Lake to Carlton were formed by ice blocks deposited in glacial outwash deposits.

Thomson Reservoir, 9-1, was formed in 1905-1907 by construction of a dam across the St. Louis River by the Great Northern Power Company. The Thomson dam and penstocks create the greatest head, 367 feet, of any hydroelectric power facility in the state. It is now owned and operated by the Minnesota Power and Light Company.

CARLTON COUNTY (9)

CARVER COUNTY (10)

Number of lakes 128
Lake area, acres. 20,290

There are two major classes of lake basins in this county. Some were formed from ice blocks buried in glacial till, such as Waconia, 10-59, and Minnewashta, 10-9. Others like Young America, 10-105, and Tiger, 10-108, were formed by the irregular deposition of glacial drift. In addition, there are several flood plain basins in the Minnesota River Valley along the eastern border of the county. Horseshoe, 10-3, is a typical oxbow basin marking a former meander of the Minnesota River. Some of the other lakes in the flood plain are located in temporary channels of the Minnesota River which were formed by flood waters during high river stages. Other lakes are related to natural levees which separate them from the main river channel. These lakes are normally shallow. Rapid, 10-17, is a typical example.

Many of the shallower lakes in the county, especially those formed by irregular deposition of till, have been partly or completely drained by artificial drainage systems.

10-128	Swan	26,27	117,118	6;31;1;36	115 (130)	x	Also in McLeod County (43), and Wright County (86). Affected by J.D. 4.

CARVER COUNTY (10)

CASS COUNTY (11)

Number of lakes 514
Lake area, acres. 258,217

The lakes of Cass County are located in a generally rugged terrain crossed by several large moraines. Many of the basins were formed by ice blocks deposited in glacial till or outwash. The following table summarizes examples of types of basins found in various parts of the county.

Origin	Ident. no.	Name	General location in county
Irregular deposition of till	11-73	Big Rice	East-central
Morainal dam along southern border of basin	11-203	Leech	Northwest
Ice block basin in till along buried SW valley extending into Hubbard County	11-480	Long	West-central
Ice block basin in outwash plain	11-308	Big Portage	Central
	11-257	Island	Central
Ice block basin in till and outwash	11-411	Pine Mountain	West-central
	11-147	Winnibigoshish	North-central
Ice block basin in till	11-120	Inguadona	Central
	11-201	Woman	Central
	11-167	Little Boy	Southeast
	11-324	Rock	South
Cuspate bar across southwest end of Leech Lake	11-414	Gould	Northwest

Rock, 11-324, is a typical "kettle" basin formed by ice blocks deposited in glacial till along a morainal ridge which extends northwest from Township 134 North, Range 30 West to Township 138 North, Range 32 West and then turns eastward across northern Cass County. Most of the basins along this ridge were formed from ice blocks.

Ten Mile, 11-413, is one of the deepest lakes in the state. The maximum depth is 208 feet. The basin was formed by ice blocks deposited in till along a preglacial valley. At the deepest point, the valley evidently received little glacial deposition. In fact, part of the basin at this point may actually be in the Precambrian bedrock.

Three of the lakes listed in the county are federal reservoirs built and operated by the U.S. Corps of Engineers. These are: Gull, 11-305, Leech, 11-203, and Winnibigoshish, 11-147. Leech and Winnibigoshish reservoirs were first operated in 1884 to aid navigation and control floods on the Mississippi River below the reservoirs. Gull Lake was added to the reservoir system in 1912.

Three other reservoirs, Cass, 4-30, Placid, 49-80, and Sylvan, 49-36, are located partly within Cass County but most of their area is in adjoining counties.

CASS COUNTY (II)

CHIPPEWA COUNTY (12)

Number of lakes 79
Lake area, acres. 9,158

The surface features of Chippewa County represent ground moraine and glacial till plains. Natural drainage of the area is poorly developed but numerous artificial drainage systems have been constructed throughout the county. The lakes are all shallow and were formed by the uneven and irregular deposition of glacial till; many of them have been drained by ditch systems. Willow, 12-2, is the largest lake in the county. It has an area of 821 acres, although 285 acres are located in adjacent Renville County. Much of the lake has been drained by a ditch system. Another Willow Lake, 12-18, has an area of 369 acres and is the largest lake entirely within the county.

CHIPPEWA COUNTY (12)

CHISAGO COUNTY (13)

Number of lakes 91
Lake area, acres. 17,855

Most of the lake basins in the county were developed from buried ice blocks in glacial drift. A chain of lakes, which extends across the southern part of the county into Anoka County, originates from ice blocks deposited in a preglacial valley. This chain includes North and South Center Lakes, 13-27 and 13-32; Lindstrom Lakes, 13-28 and 13-35; Chisago, 13-12; Green, 13-41; and a number of small kettle hole lakes in the area. Rush, 13-69, was formed from a series of interconnected buried ice blocks.

Large lakes in the county include the following:

Name	Ident. no.	Area, acres
Rush	13-69	3,170
Sunrise River Addition (Pools 1 and 3)	13-59	2,354
Green	13-41	1,830
Chisago	13-12	930
South Center	13-27	913
Sunrise	13-31	810
North Center	13-32	760
Goose	13-83	710
South Lindstrom	13-28	664

The Sunrise River Addition to the Carlos Avery Wildlife Management Area contains the largest reservoir, 13-59, in Chisago County. It was formed by dams constructed on the Sunrise River and has a water area of 2,354 acres. A reservoir, 13-37, created by a dam on the Sunrise River at Kost, is a former private hydropower reservoir which is now used as a state game refuge.

CHISAGO COUNTY (13)

CLAY COUNTY (14)

Number of lakes 107
Lake area, acres. 4,650

All of the lakes in the county are located in the morainal region along the eastern boundary. Nearly all were formed by ice blocks deposited in the glacial till. The remainder of the county consists of generally flat terrain devoid of lakes, which represents the old lake basin of Glacial Lake Agassiz.

The largest lake located entirely within the county is Lee, 14-49, which has an area of 148 acres. Tilde, 14-4, has a total area of 256 acres, but 110 acres of the lake are located in Becker County.

An artificial lake basin, Barnesville, 14-93, was formed by a dam constructed across Whiskey Creek in Barnesville before 1936.

CLAY COUNTY (14)

CLEARWATER COUNTY (15)

Number of lakes 164
Lake area, acres. 40,829

The lake basins in this county were formed generally by ice blocks buried in glacial drift of the Altamont-Gary moraines which form a divide between the Mississippi River and Red River drainages. Itasca, 15-16, which is the source of the Mississippi River, was formed by ice blocks deposited in a preglacial valley and buried by outwash. The pattern of the basins generally corresponds to the distribution of morainal hills in the area. A series of basins located along the northern boundary of the county were probably formed by ice blocks deposited in a terminal moraine which later collapsed and was covered by lake sediments of Glacial Lake Agassiz.

CLEARWATER COUNTY (15)

COOK COUNTY (16)

Number of lakes	812
Lake area, acres (excluding Lake Superior)	101,152
Lake Superior area adjacent to Cook County, acres	962,700

In Cook County most of the lake basins have been formed as a result of glacial erosion rather than glacial deposition as in other areas of the state. The shape and orientation of these basins are controlled by the type of bedrock structure in which they are located. The majority of the lakes in the northern half of the county occupy long narrow bedrock basins, many of which were localized by preglacial valleys that were frequently dammed by glacial drift deposits. In much of the southern half of the county where the land surface is covered with a thicker mantle of glacial deposits, basins formed by ice blocks deposited in glacial till are more common. The following table shows some typical examples of lake basin formation and the relation to bedrock type or surface formation.

ORIGIN OF COOK COUNTY LAKE BASINS

Ident. no.	Name	General Location	Bedrock type and character of basin
		Bedrock basins localized by preglacial valleys	
16-244 16-119	South Crocodile	In band of lakes 3 to 5 miles wide extending along Canadian border from Gunflint, 16-356, to Moose, 16-43.	Rove slates and lava flows. East-west elongated basins located in ridges between intrusive igneous rocks.
16-354 16-41	Winchell Pine	In region south of border lakes, extending across northern half of T. 64 N., Rs. 3 W through 2 E.	Duluth Gabbro. East-west elongated basins located in valleys along bands of differential erosion in gabbro.
		Bedrock basins dammed by glacial drift	
16-348	Brule	T. 63 N., Rs. 2, 3 W.	Duluth Gabbro. East-west lakes caused by glacial drift dams at southern and western edges of basins.
16-346	Cascade	T. 62 N., Rs. 2, 3 W.	
		Bedrock basins not related to preglacial valleys	
16-633	Saganaga	Along Canadian border at northwest corner of county.	Saganaga Granite. Linear segments of basins located along joint patterns in granite.
16-629	Seagull	South of Saganaga, 16-633	
		Ice block basins in glacial till	
16-369	White Pine	Southwest part of county, in T. 61 N., R. 5 W.	Glacial till overlying Duluth Gabbro bedrock.
16-645	Toohey	TS. 60, 61 N., R. 5 W.	

South Fowl, 16-34, is a reservoir created by construction of a privately owned dam across the basin outlet in 1898. A new dam was built in 1934.

COTTONWOOD COUNTY (17)

Number of Lakes. 60
Lake area, acres. 9,154

Most of the county lake basins were formed by the uneven deposition of glacial till. Several in the southern part of the county, including Cottonwood, 17-22, and Talcot, 17-60, were formed from ice blocks, partly in till and partly in outwash. Many of the lakes have been completely or partly drained by artificial drainage systems. Mountain, 17-2, which has an area of 1,002 acres and is the largest lake in the county, is completely drained by a ditch system.

There are three artificial lakes in the county which are listed in the following table:

Ident. no.	Name	Area, acres	Remarks
17-3	Mountain	241	Created in 1938 by construction of a dam across a small tributary of the South Fork of the Watonwan River near Mountain Lake Village.
17-21	Warren	133	Created in 1936 by construction of a dam across Judicial Ditch 5 near Windom. State-owned dam.
17-25	– –	69	Recreation reservoir formed by dam across the Des Moines River at Windom. Built in 1878 for flour mill operation, it is now owned by City of Windom.

CROW WING COUNTY (18)

Number of lakes. 416
Lake area, acres. 101,769

Most of the lake basins in Crow Wing County were formed from ice blocks deposited in glacial outwash or till associated with the St. Croix moraine. There are, however, basins of many different origins in the county as illustrated by the following examples:

Origin	Ident. no.	Name	Remarks
Ice block basins in outwash plain	18-242	Upper Mission	The most common type of basin including many of lakes west of Mississippi River.
	18-378	Lower Hay	
Ice block basins in outwash localized by a preglacial valley	18-136	Long	Along Nokasippi River valley.
Ice block basins in glacial till	18-293	Kego	In morainal areas along eastern and northern boundaries of county
	18-20	Borden	
Esker troughs	18-76	Long	In region of long sinuous gravelly ridge in southeastern part of county.
Ice block basins partly in glacial till and partly in glacial outwash	18-294	Mitchell	In north-central part of county.
Isolation of a small bay on a larger lake.	18-401	Hole-in-the-Day	Formed by isolation of a small bay of Gull, 11-305.
An oxbow lake	18-238	Half Moon	Meander of Mississippi River cut off from main stream.
Mining operations Old mine pit	18-119	Roe	

Large lakes entirely within the county are:

Ident. no.	Name	Area, acres
18-308	Pelican	8,468
18-310	Whitefish	7,969
18-372	Long	6,178
18-305	Edward	2,844
18-34	Bay	2,435
18-312	Cross	1,884
18-373	Round	1,706
18-315	Big Trout	1,486
18-136	Long	1,380
18-375	Hubert	1,344
18-90	Serpent	1,154
18-20	Borden	1,038

(continued

There are several chains of lakes in the county which are parts of two federal reservoir systems. The Pine River system was originally completed in 1886 and the Gull Lake system in 1913. Lakes included in each reservoir system are listed below:

Pine River reservoir system

Control structure for system is located at outlet of Cross Lake

Ident. no.	Name
18-312	Cross
18-266	Little Pine
18-268	Loon
18-269	Island
18-270	Hen
18-271	Daggett
18-288	Ox
18-310	Whitefish
18-311	Rush
18-354	Pig
18-356	Clamshell
18-366	Arrowhead
18-378	Lower Hay
18-412	Upper Hay

Gull Lake reservoir system

Control structure for system is located at outlet of Gull, 11-305

Ident. no.	Name
18-373	Round
18-376	Upper Cullen
18-377	Middle Cullen
18-398	Roy
18-399	Nisswa
18-403	Lower Cullen

A private reservoir is located near Brainerd. This reservoir, Rice, 18-145, was formed as a result of construction of a dam across the Mississippi River. The original dam was built in 1881. The reservoir is presently used to pond water for a hydropower operation for a paper mill plant.

DAKOTA COUNTY (19)

Number of lakes 83
Lake area, acres. 10,255

Most of the lakes are located in the hilly region in the northern and western parts of the county representing the St. Croix moraine. These lakes were formed mainly from ice blocks deposited in till. Orchard, 19-31, and Marion, 19-26, were formed from ice blocks deposited in a till-filled preglacial valley.

Several lakes are located in the flood plains of the Minnesota and Mississippi Rivers along the northern county boundary. They mark the position of minor sloughs and temporary channels formed by floodwaters. Two flood-plain basins shown on the map as River and Spring Lakes have been engulfed by U.S. Lock and Dam No. 2 pool, 19-5, and are not listed as separate lakes in the tabulation. U.S. Lock and Dam No. 2 was originally put into operation on July 3, 1917. It has been improved and reconstructed and is one of eleven navigation dams on the Mississippi River in Minnesota. Byllesby Reservoir, 19-6 was formed by a dam constructed in 1911 across the Cannon River near Cannon Falls in Goodhue County. It is a hydropower storage reservoir presently owned and operated by Northern States Power Company.

DAKOTA COUNTY (19)

DODGE COUNTY (20)

Number of lakes 12
Lake area, acres 1,716

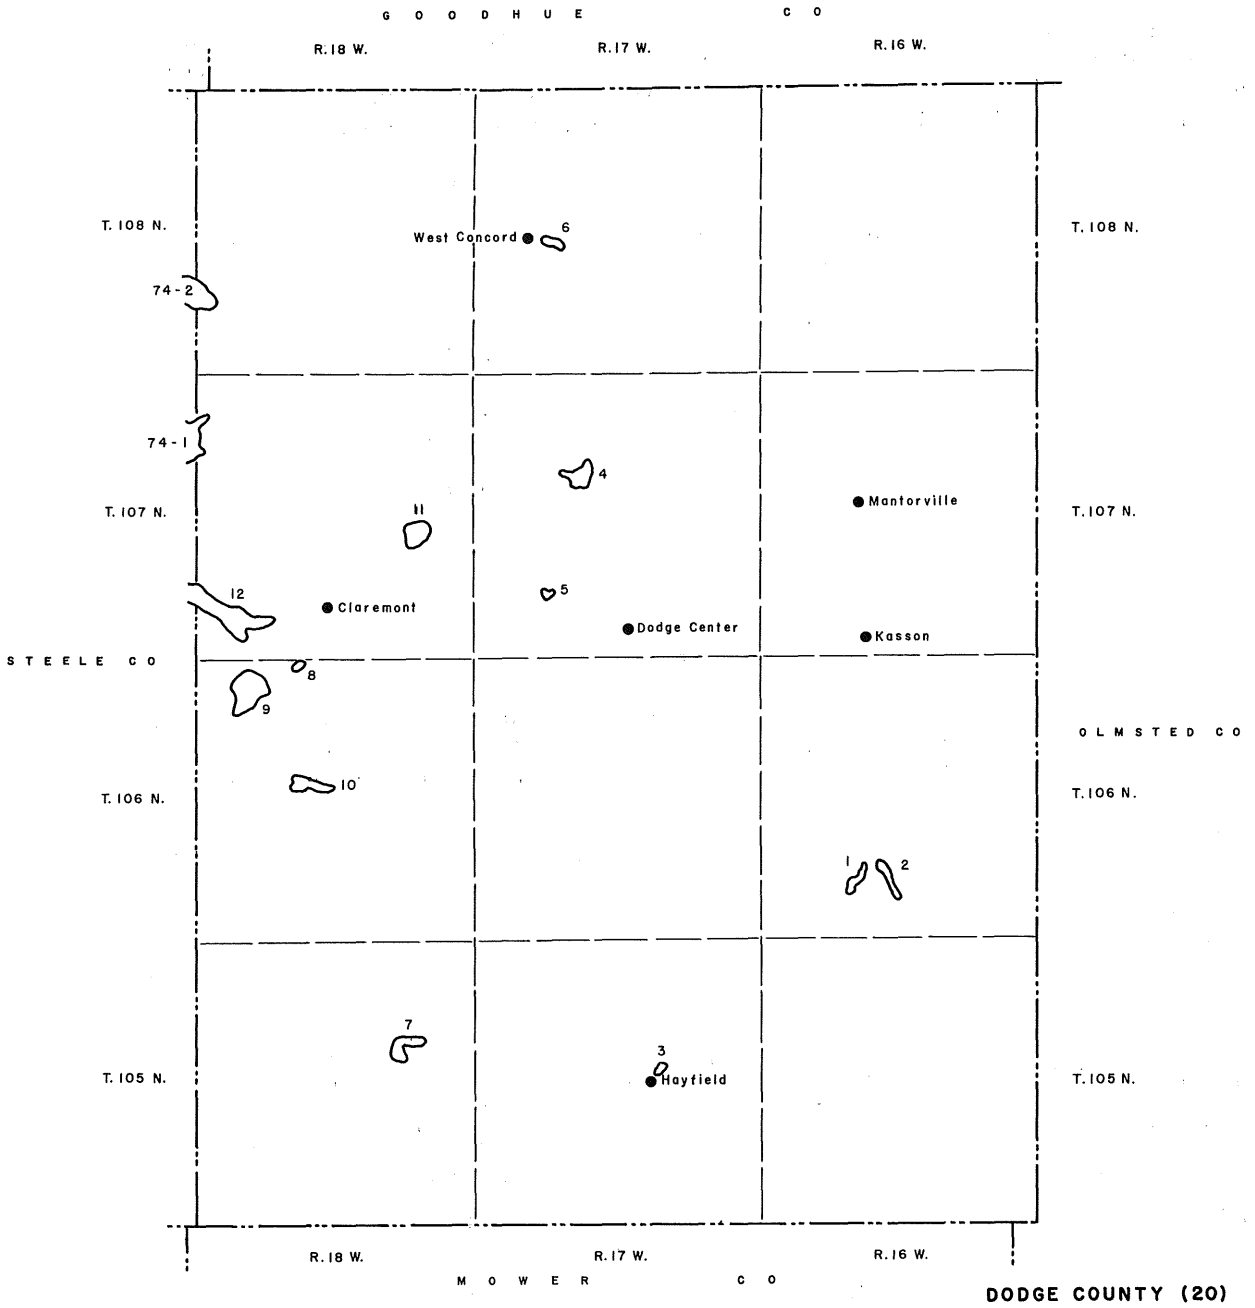

There are few lakes in the county and only one, 20-5, contains sufficient water to be classed as a lake. The remaining lakes have been affected by drainage and are dry.

All of the lakes listed were probably formed by the irregular deposition of glacial till.

DODGE COUNTY (20)

DOUGLAS COUNTY (21)

Number of lakes 375
Lake area, acres. 65,519

The lake basins in Douglas County were formed mainly from ice blocks buried in glacial till and outwash associated with the Alexandria moraine. A chain of lake basins extending southward across the center of the county from Carlos, 21-57, to Latoka, 21-106, were formed from ice blocks deposited in outwash filling a preglacial valley. The following table lists types of lake basins in the county:

Origin	Ident. no.	Name
Ice block basins in outwash in preglacial valleys.	21-57	Carlos
	21-80	Darling
Ice block basins in till.	21-108	Mina
	21-144	Lobster
Ice block basins in outwash plain.	21-52	Geneva
	21-101	Stoney
Ice block basins in till and outwash.	21-16	Smith
	21-123	Ida

DOUGLAS COUNTY (21)

FARIBAULT COUNTY (22)

Number of lakes 91
Lake area, acres. 12,240

Most of the lake basins in the county were formed by the irregular deposition of glacial till in ground moraine. Typical examples include Rice, 22-75, Gorman, 22-89, Swan, 22-49, and Walnut, 22-23.

Rice, 22-7, occupies a basin which is a remnant of a former glacial lake which once drained southward toward the Des Moines River.

FARIBAULT COUNTY (22)

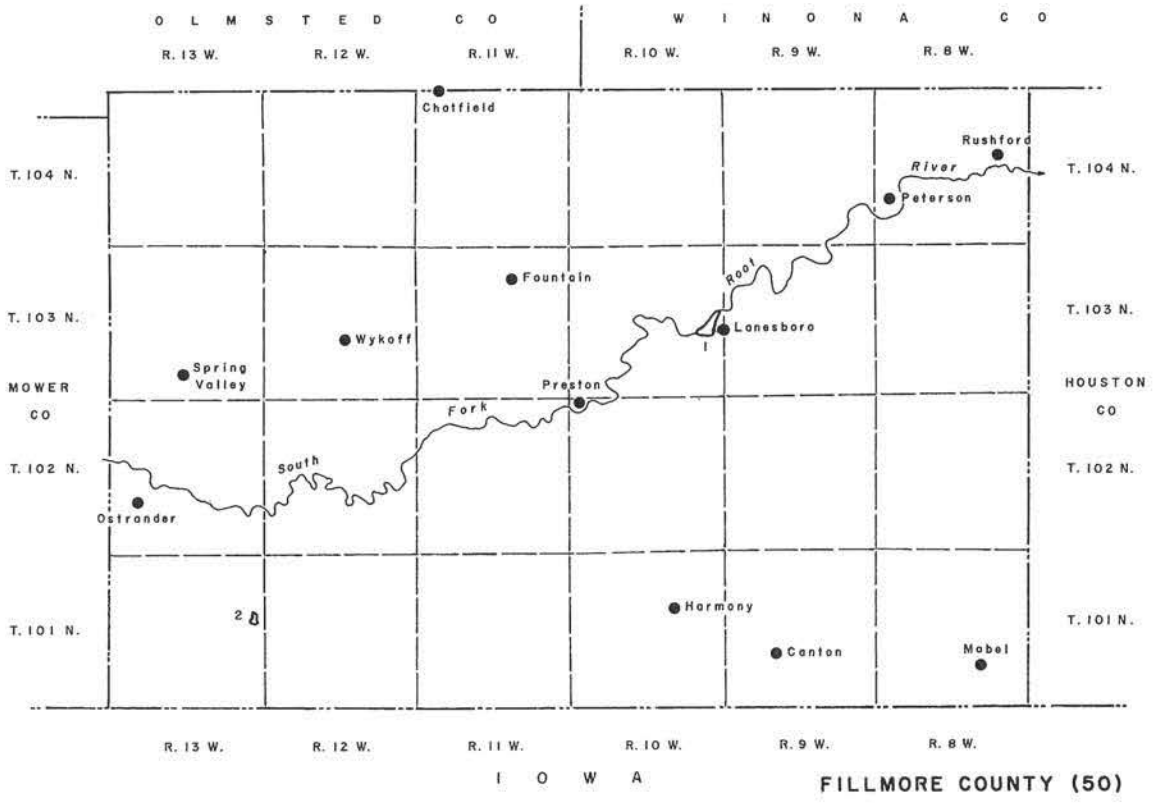

FILLMORE COUNTY (23)

Number of lakes 2
Lake area, acres. 112

Fillmore County was very lightly glaciated and is practically devoid of natural lake basins. The only natural lake listed, 23-2, is a small boggy area which has discernible banks but usually does not contain standing water. Both lakes listed are affected by drainage or dry.

Ident. number	Name	Location Range	Township	Section	Area in Acres	Meandered	Remarks
23-1	Lanesboro Mill Pond	10	103	NW 24	98	. . .	Former mill reservoir, now filled with silt.
23-2	. . . . .	13	101	C 13	14	. . .	Affected by ditch.

There are several impoundments behind dams in streams that are confined within stream banks and create no reservoirs of notable size. Lanesboro Mill Pond, listed above, has been completely filled with silt and ineffective for 20 years or more. A Farrington Lake is mentioned in publications as located in T. 104 N., R. 12 W., Section 24, and having the Root River running through it. As it cannot be discerned on either the aerial photographs or topographic maps, its size cannot be determined.

FREEBORN COUNTY (24)

Number of lakes 49
Lake area, acres. 20,852

The lake basins in the county were formed primarily from ice blocks in glacial till or in till and outwash. Two large lake basins in the center of the county, Fountain, 24-18, and Albert Lea, 24-14, were formed from ice blocks which were dropped in a till-filled preglacial valley. Geneva, 24-15, is a remnant of a much larger glacial lake which once extended as far east as Maple Island. Freeborn, 24-44, and Rice, 24-11, are in basins formed by the irregular deposition of glacial till.

Over half of the basins listed in the county are affected by artificial drainage systems.

Fountain, 24-18, was originally formed by construction of a mill dam across the Shell Rock River in 1856; this dam was destroyed in 1881. A new dam was built in the early 1900's by the city and is maintained for recreational purposes.

FREEBORN COUNTY (24)

GOODHUE COUNTY (25)

Number of lakes 23
Lake area, acres. 16,375

The natural lake basins are all located along the northeastern boundary of the county in the Mississippi River valley. Pepin, 25-1, was formed when the Chippewa River, a tributary of the Mississippi River in Wisconsin, deposited large amounts of sediments into the channel of the Mississippi River which caused partial damming. Most of the smaller lakes adjacent to Lake Pepin are delta basins which were originally part of the main lake but have been isolated from it by the deposition of alluvium. Water levels of Lake Pepin are presently regulated by U.S. Lock and Dam No. 4 which is located near Alma, Wisconsin. The dam was completed by the U.S. Corps of Engineers as part of the Mississippi River navigation system in 1935.

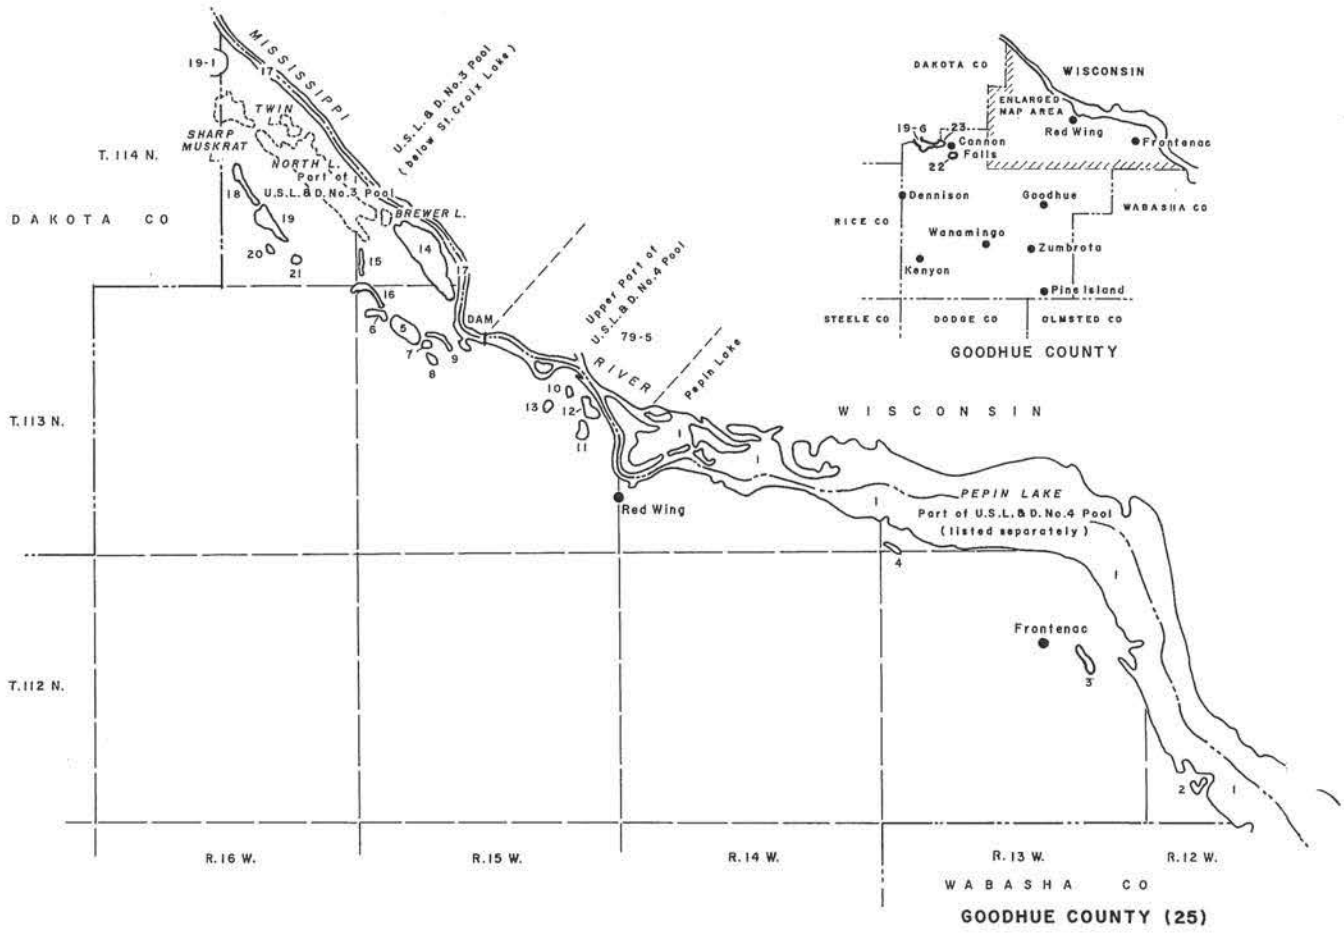

U.S. Lock and Dam No. 3 Pool, 25-17, was formed by a dam constructed across the Mississippi River at Red Wing by the U.S. Corps of Engineers in 1931.

19-6	Byllesby				705 (1,480)	...	See Dakota County (19).

GOODHUE COUNTY (25)

GRANT COUNTY (26)

Number of lakes 307
Lake area, acres. 24,582

The lake basins are located in the eastern three-fourths of the county in the area which is covered by glacial moraines. The western one-fourth of the county is covered by glacial lake sediments derived from Glacial Lake Agassiz and is devoid of basins.

The lake basins were formed by the irregular deposition of till, by ice blocks deposited in till, and by ice blocks deposited in outwash. Several series of lake basins extending along the present valleys of the Mustinka and Pomme de Terre Rivers were formed by ice blocks deposited in outwash sediments which filled preglacial valleys that are below the present river valleys.

The following table lists some typical examples of lake basin origin:

Origin	Ident. no.	Name
Basin formed by irregular deposition of till	26-216	Barrows
	26-185	Cottonwood
	26-204	Graham
Basins formed by ice blocks deposited in till	26-2	Pelican
	26-117	Cormorant
Basins formed by ice blocks deposited in outwash filling preglacial valleys	26-95	Barrett
	26-97	Pomme de Terre
	26-186	Burr
	26-282	Lightning
Basins formed by ice blocks deposited in till filling preglacial valleys	26-46	Lower Elk
	26-32	Spring

The Mustinka River Reservoir, 26-235, was formed by a dam across the Mustinka River completed in 1940. The dam is owned by the State of Minnesota.

GRANT COUNTY (26)

HENNEPIN COUNTY (27)

Number of lakes 200
Lake area, acres. 36,814

The lakes in Hennepin County were formed by ice blocks deposited in glacial drift. Minnetonka, 27-133, the largest lake in the county, was formed when a number of ice blocks created a series of interconnected basins in terminal moraine. The eastern part of the county, Ranges 22 through 24, is characterized by several extensive chains of lakes which were formed from ice blocks in till-filled preglacial valleys. These buried valleys are oriented in a north-south direction. The most prominent chain of lakes includes Twin, 27-42, Sweeney-Twin, 27-35, Wirth, 27-37, Brownie, 27-38, Cedar, 27-39, Lake of the Isles, 27-40, Calhoun, 27-31, and Harriet 27-16. In addition to the ice block lake basins, there are also several along the Minnesota River valley at the southern edge of the county which were flood plain basins that are related to natural levees or were formed by the uneven aggradation of the flood plain by the Minnesota River.

The large lakes listed in the county include the following:

Ident. no.	Name	Area, acres
27-133	Minnetonka	14,310[1]
27-2	Long Meadow	1,425
27-104	Medicine	924
27-176	Independence	828
27-191	Sarah	586
27-184	Whaletail	582
27-80	Grass	580

[1] Includes 119 acres in Carver County (10)

Reservoirs in Hennepin County

Ident. no.	Name	Remarks
27-3	U.S. Lock and Dam No. 1 Pool	Originally formed by dam built in 1917 across Mississippi River at Minneapolis. Part of U.S. Corps of Engineers Mississippi River navigation system.
27-41	Edina Mill Pond	Former mill reservoir originally formed by dam across Minnehaha Creek at Edina in 1857. Now used as a recreation pool.
27-43	Coon Rapids Pool	Formed by hydropower dam constructed across Mississippi River at Coon Rapids in 1913-1914. Operated by Northern States Power Company as a hydropower storage reservoir.
27-61	Champlin Mill Pond	Originally formed by a flour mill dam built across Elm Creek at Champlin in 1867. Now used as a recreation pool.

HENNEPIN COUNTY (27)

HOUSTON COUNTY (28)

Number of lakes 15
Lake area, acres. 12,545

Houston County represents the only unglaciated area in Minnesota and consequently is nearly devoid of natural lake basins. The only lakes listed are located along the Mississippi River and the lower Root River valleys. Six lakes along the Mississippi River, and six along the Root River, were formed by the uneven aggradation of the flood plain.

Following are some examples of lakes formed by dams.

Ident. no.	Name	Remarks
28-1	U.S. Lock and Dam No. 9 Pool	Formed by dam built in 1937 across the Mississippi River near Harpers Ferry, Iowa. Operated by U.S. Corps of Engineers as part of the Mississippi River navigation system.
28-5	U.S. Lock and Dam No. 8 Pool	Formed by dam built in 1938 across the Mississippi River near Genoa, Wisconsin. Operated by U.S. Corps of Engineers as part of the Mississippi River navigation system.
28-9	Como	Originally formed by mill dam constructed across Thompson Creek in 1852. A new dam was built in 1922 by the Village of Hokah for a recreational pool. It is now completely filled with silt.

HOUSTON COUNTY (28)

HUBBARD COUNTY (29)

Number of lakes 313
Lake area, acres. 43,318

The majority of the lake basins in the county were derived from ice blocks which were deposited in glacial till or outwash. Most of the basins in the northern townships, Townships 144 and 145, were formed by ice blocks deposited in glacial till although some of the basins may have been formed by the uneven distribution of till. The greatest number of lakes in the county are located in the hilly morainal region which extends across the central part of the county, Townships 141 through 143. These basins were predominantly formed by ice blocks deposited in till. The lake basins in the southern townships, including Township 139 and most of 140, originated from ice blocks which were buried in glacial outwash. Several chains of lakes in the southeastern part of the county were formed from ice blocks deposited in outwash or till-filled preglacial valleys. Lake basins in this category include part of the Crow Wing chain extending from Eleventh Crow Wing, 29-36, southwestward to Fifth Crow Wing, 29-92. A chain of smaller lake basins, 29-1 through 29-5, occupies another preglacial valley. Long, 29-161, was formed from a series of ice blocks deposited in an outwash-filled valley. LaSalle, 29-309, is an ice block basin which was deposited in till along a preglacial valley. At its deepest point, 204 feet, the basin may be bedrock. Evidently this valley did not receive a great amount of sediment deposition.

The large lakes entirely within the county include the following:

Ident. no.	Name	Area, acres
29-75	Kabekona	2,607
29-243	Potato	2,239
29-161	Long	1,863
29-151	Big Mantrap	1,770
29-185	Big Sand	1,738
29-242	Fish Hook	1,432
29-146	Belle Taine	1,252
29-101	Crooked	1,020

Another large lake basin which is mostly in Hubbard County but extends into Beltrami County is Plantaganette, 29-156, which has a total area of 2,620 acres.

HUBBARD COUNTY (29)

ISANTI COUNTY (30)

Number of lakes 145
Lake area, acres. 12,164

Ice blocks deposited in till and outwash formed most of the lake basins in Isanti County. The lake basins in the western half of the county originated from ice blocks deposited in outwash or till plains. In the eastern half of the county, many of the lake basins are oriented in chains extending in a general north-south direction along outwash-filled preglacial valleys. The largest lakes in the county include 30-136, Green, 866 acres; 30-138, South Stanchfield, 433 acres; and, 30-72, Long, 376 acres.

ISANTI COUNTY (30)

ITASCA COUNTY (31)

Number of lakes 945
Lake area, acres. 183,768

Itasca County is covered with great thicknesses of glacial sediments and contains a wide variety of lake basins. Many were formed from ice blocks deposited in both glacial till and outwash and others were formed through irregular deposition of drift.

Coon, 31-524, is an esker trough lake located several miles east of the village of Bigfork.

Several lake basins located along the western Mesabi iron range have been altered by iron mining activity.

Reservoirs in Itasca County

Ident. no.	Name	Remarks
31-384	Prairie	Formed by dam built in 1921 across Prairie River near Grand Rapids. Owned and operated by Blandin Power Company as hydropower reservoir for paper company.
31-532	Pokegama	Formed by dam across the Mississippi River at Pokegama Falls, completed in 1884. Operated by U.S. Corps of Engineers as part of Mississippi River Headwaters reservoir system.
31-533	Blandin	Formed by dam built across the Mississippi River at Grand Rapids in 1900. Operated as water supply and power reservoir by Blandin Paper Company.

JACKSON COUNTY (32)

Number of lakes 84
Lake area, acres. 17,042

The lake basins in the county were formed by the uneven distribution of glacial till in ground moraine. They are all shallow basins; many have been filled with sediment and most have been affected by drainage ditches.

Heron, 32-57, is the largest lake, 8,251 acres, in the county. Other large lakes entirely in the county include Round, 32-69, 947 acres; Loon, 32-20, 738 acres, and Flaherty, 32-45, 464 acres.

KANABEC COUNTY (33)

Number of lakes 41
Lake area, acres. 4,837

The lake basins in this county are found associated with glacial drift and ice block depressions in outwash sediments, deposited by the Superior ice lobe. The distribution and pattern of these basins reflect the direction of glacial movement across the county, generally northeast to southwest. Three of the largest lakes in the county are impoundments created by the construction of dams across streams. The largest is Knife, 33-28, which is formed by a dam across the Knife River and has an area of 1,127 acres. Both Fish, 33-36, covering 440 acres, and Ann, 33-40, covering 363 acres, are impoundments formed by dams built across the Ann River.

KANDIYOHI COUNTY (34)

Number of lakes 361
Lake area, acres. 61,637

Kandiyohi County lake basins originate from the uneven deposition of glacial till in ground moraine and from ice block depressions in terminal moraine. Big Kandiyohi, 34-86, is a large shallow lake formed in ground moraine. Such basins often undergo severe fluctuation of water levels. In contrast, Green, 34-79, is a large deep lake, typical of basins formed by ice block depressions in the terminal moraine region which extends through the northern part of the county.

The following table lists some of the large lakes entirely within the county:

Ident. no.	Name	Area, acres
34-79	Green	5,821
34-86	Big Kandiyohi	2,877
34-251	Norway	2,496
34-169	Wagonga	1,792
34-192	Long	1,715
34-44	Diamond	1,697
34-72	Lillian	1,608
34-62	Calhoun	1,396
34-170	Grass	1,227
34-22	Elizabeth	1,153
34-154	Nest	1,019

Mud, 34-158, was formed by reconstructing a former mill dam which had been built on the Middle Fork of the Crow River at New London in 1864. As a result of the dam reconstruction, Mud Lake, a meandered lake, was enlarged to its present area which is nearly eight times as great as the natural basin.

KANDIYOHI COUNTY (34)

KITTSON COUNTY (35)

Number of lakes 5
Lake area, acres. 829

There are very few lakes in Kittson County. Upper and Lower Twin Lakes, 35-1 and 35-2, are directly related to a collapsed portion of beaches deposited by Glacial Lake Agassiz which crosses the southeastern part of the county. They occupy shallow basins between a series of beach ridges. The water levels in these lakes are maintained by ground water seepage from the ridges. Scull, 35-4, is in a region which was once part of an extensive marshy area. Bronson, 35-3, is a reservoir formed by a dam on the South Fork of Two Rivers which was completed in 1938. It is located in Lake Bronson State Park.

Ident. number	Name	Location Range	Township	Section	Area in Acres	Meandered	Remarks
35-1	Upper Twin.....	45	159	3,10	218	x

35-5	Stella.....	51	163	1,2,11	23	...	

KOOCHICHING COUNTY (36)

Number of lakes 24
Lake area, acres. 32,003

The lake basins in the southern part of the county were formed from ice blocks deposited in glacial till. The few lakes in the northern part of the county occupy depressions in the bed of former Glacial Lake Agassiz. These lakes are quite shallow and have been largely filled with organic sediments through bog succession. The dominant control appears to be the irregular depressions in the bedrock surface of the area where ice lenses were buried by glacial drift and later with lake sediments from Lake Agassiz.

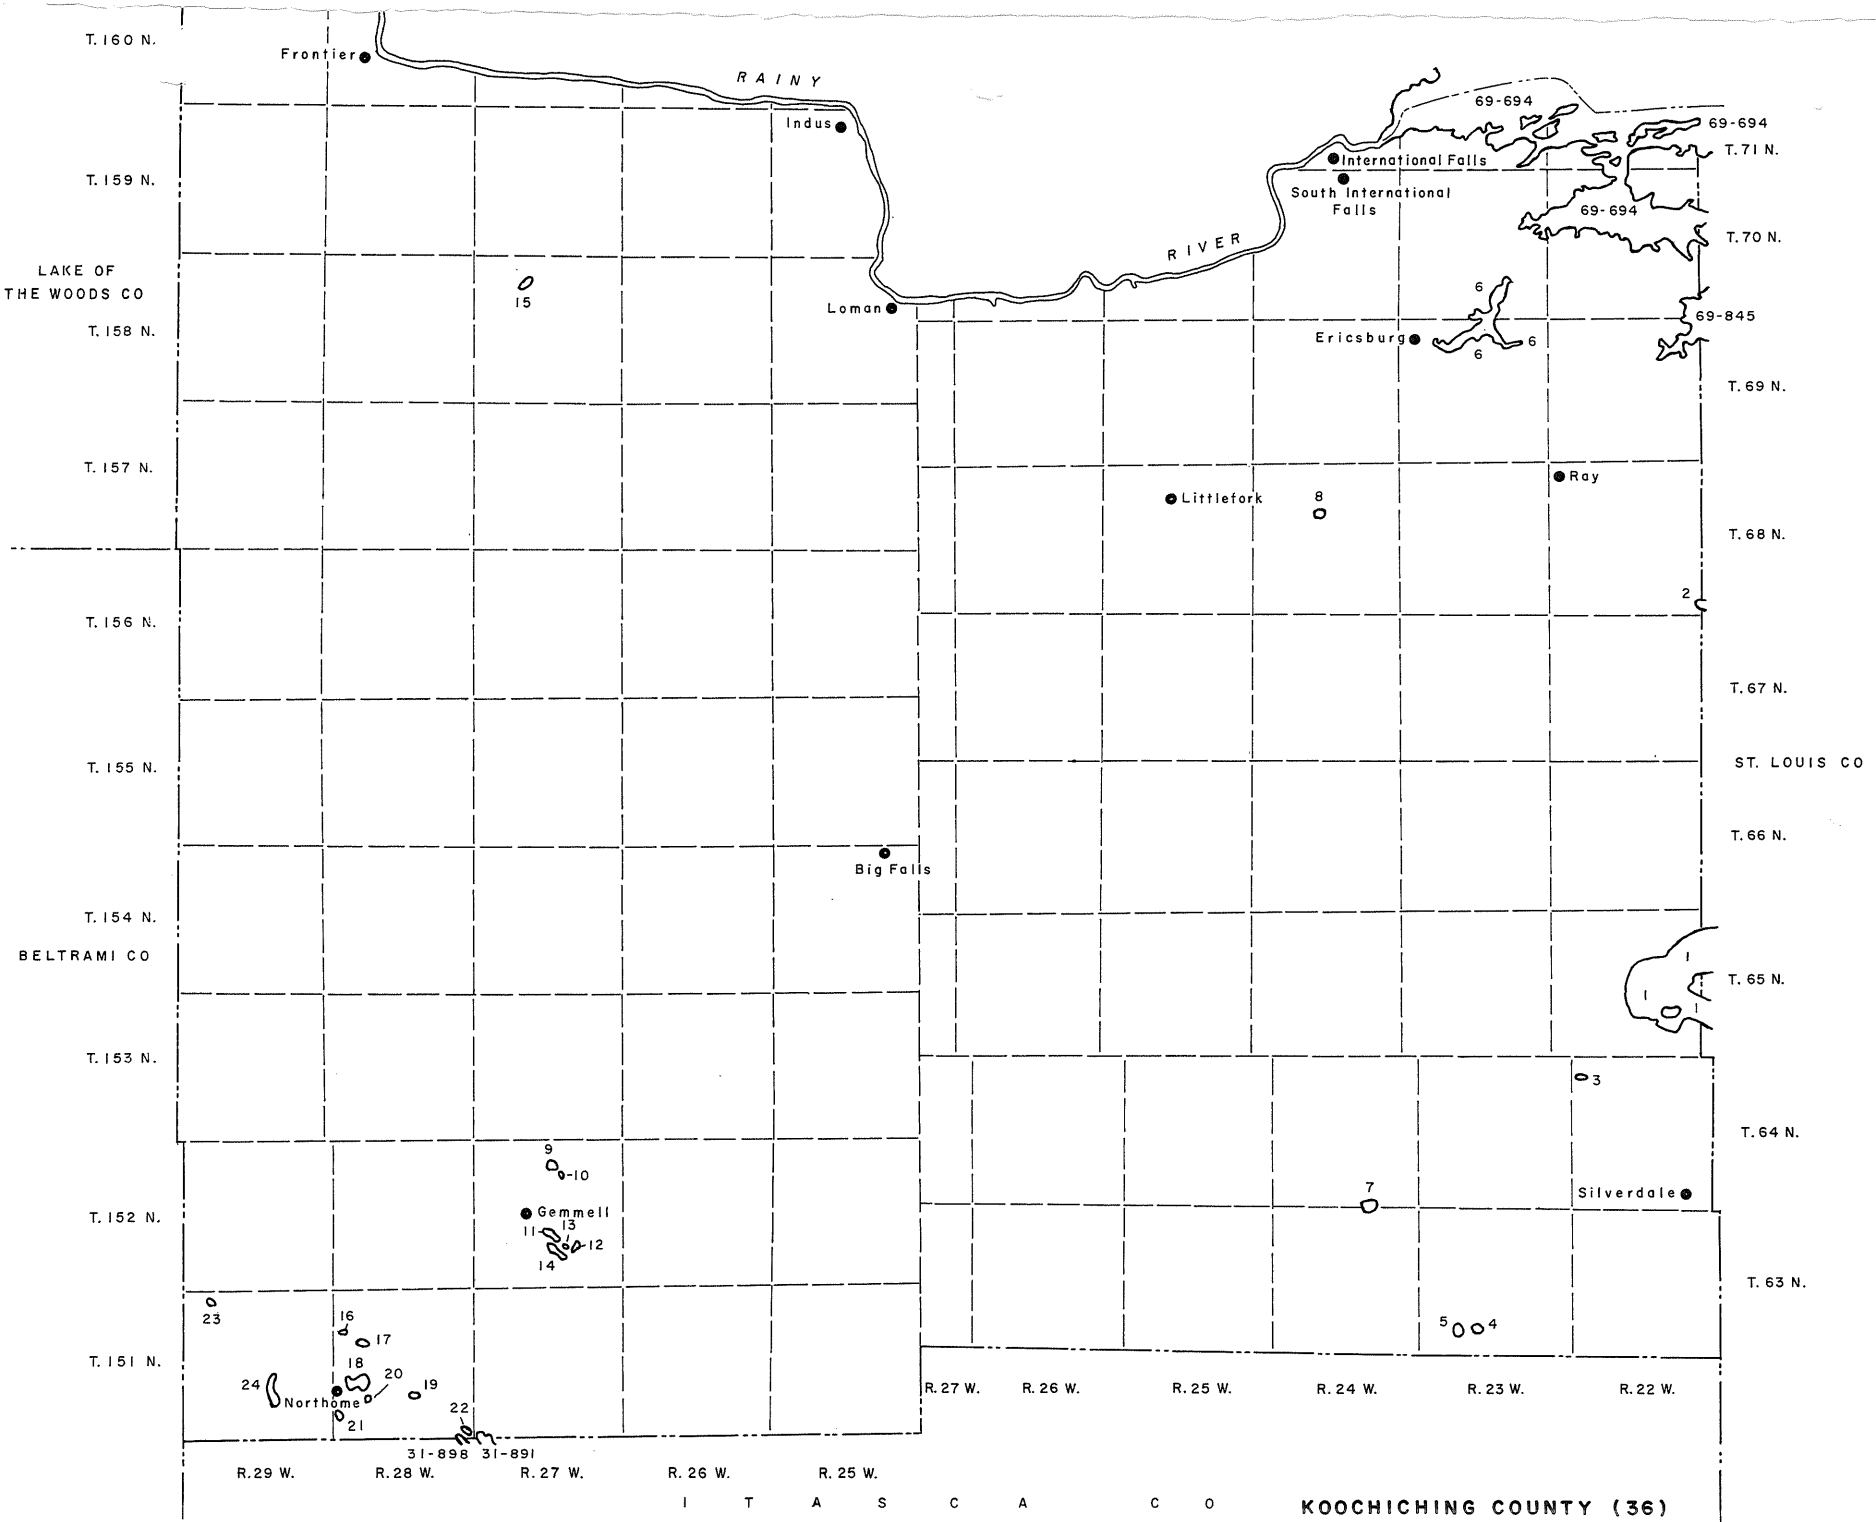

Rat Root, 36-6, area 555 acres, is the largest lake entirely in the county. Nett, 36-1, has a total area of 7,369 acres, 4,650 of which is in Koochiching County.

KOOCHICHING COUNTY (36)

LAC QUI PARLE COUNTY (37)

Number of lakes 229
Lake area, acres. 16,770

Lac Qui Parle County lakes are mostly shallow and many have been partly filled with sediment and are affected by artificial drainage systems. These basins were formed by the irregular deposition of glacial till.

Lac Qui Parle, 37-46, is the largest lake in the county. This basin was formed when alluvium deposited at the mouth of the Chippewa River created a natural dam across Glacial River Warren, now the Minnesota River. A dam was constructed at the outlet of the basin in 1936-1937 creating a flood control and water conservation reservoir. The reservoir has been operated by the U.S. Corps of Engineers since 1950.

LAKE COUNTY (38)

Number of lakes [1]	817
Lake area, acres (except Lake Superior)	118,038
Lake Superior area adjacent to Lake County	382,200

The lake basins in the northern half of the county and along the shore of Lake Superior in the southern half were formed as a result of glacial erosion of the bedrock which is exposed at the surface over much of the area. These bedrock lake basins are the result of differential erosion of the bedrock surface by the several glaciers which crossed the area. The orientation of the basins is a reflection of the nature of the bedrock that was eroded. Some of the basins are localized in preglacial valleys.

The lake basins in the southern part of the county were formed primarily by glacial deposition and consist of basins derived from ice blocks deposited in drift and from the uneven distribution of glacial till.

Large lake basins entirely within the county include the following:

Ident. no.	Name	Area, acres
38-529	Snowbank	4,819
38-397	Insula	2,550
38-226	Kekekabic	1,905
38-220	Perent	1,844
38-351	Thomas	1,721
38-330	Alice	1,684
38-498	Ensign	1,583
38-637	Bald Eagle	1,507
38-656	Greenwood	1,469
38-396	Isabella	1,318
38-644	Moose	1,307
38-219	Silver Island	1,294
38-701	Gabbro	1,174
38-600	Three	1,085

[1] Includes six lakes along the Minnesota-Ontario border with most of their area in Canada. Excludes Garden Lake Reservoir which consists of four numbered lakes.

Following are large lakes located along the Minnesota-Ontario border:

Ident. no.	Name	Area, acres
38-645	Basswood	29,400
38-404	Knife	5,536 [2]
38-521	Carp	1,287 [2]
38-211	Cypress	1,092 [2]

[2] Lake basin is mostly in Canada.

Garden Lake Reservoir, 38-738, was formed by a dam built in 1925-1926 across the Kawishiwi River near Ely. The reservoir is operated as a hydropower storage reservoir by the Minnesota Power and Light Company. The reservoir system includes five meandered lake basins.

LAKE OF THE WOODS COUNTY (39)

Number of lakes 5
Lake area, acres. 317,297

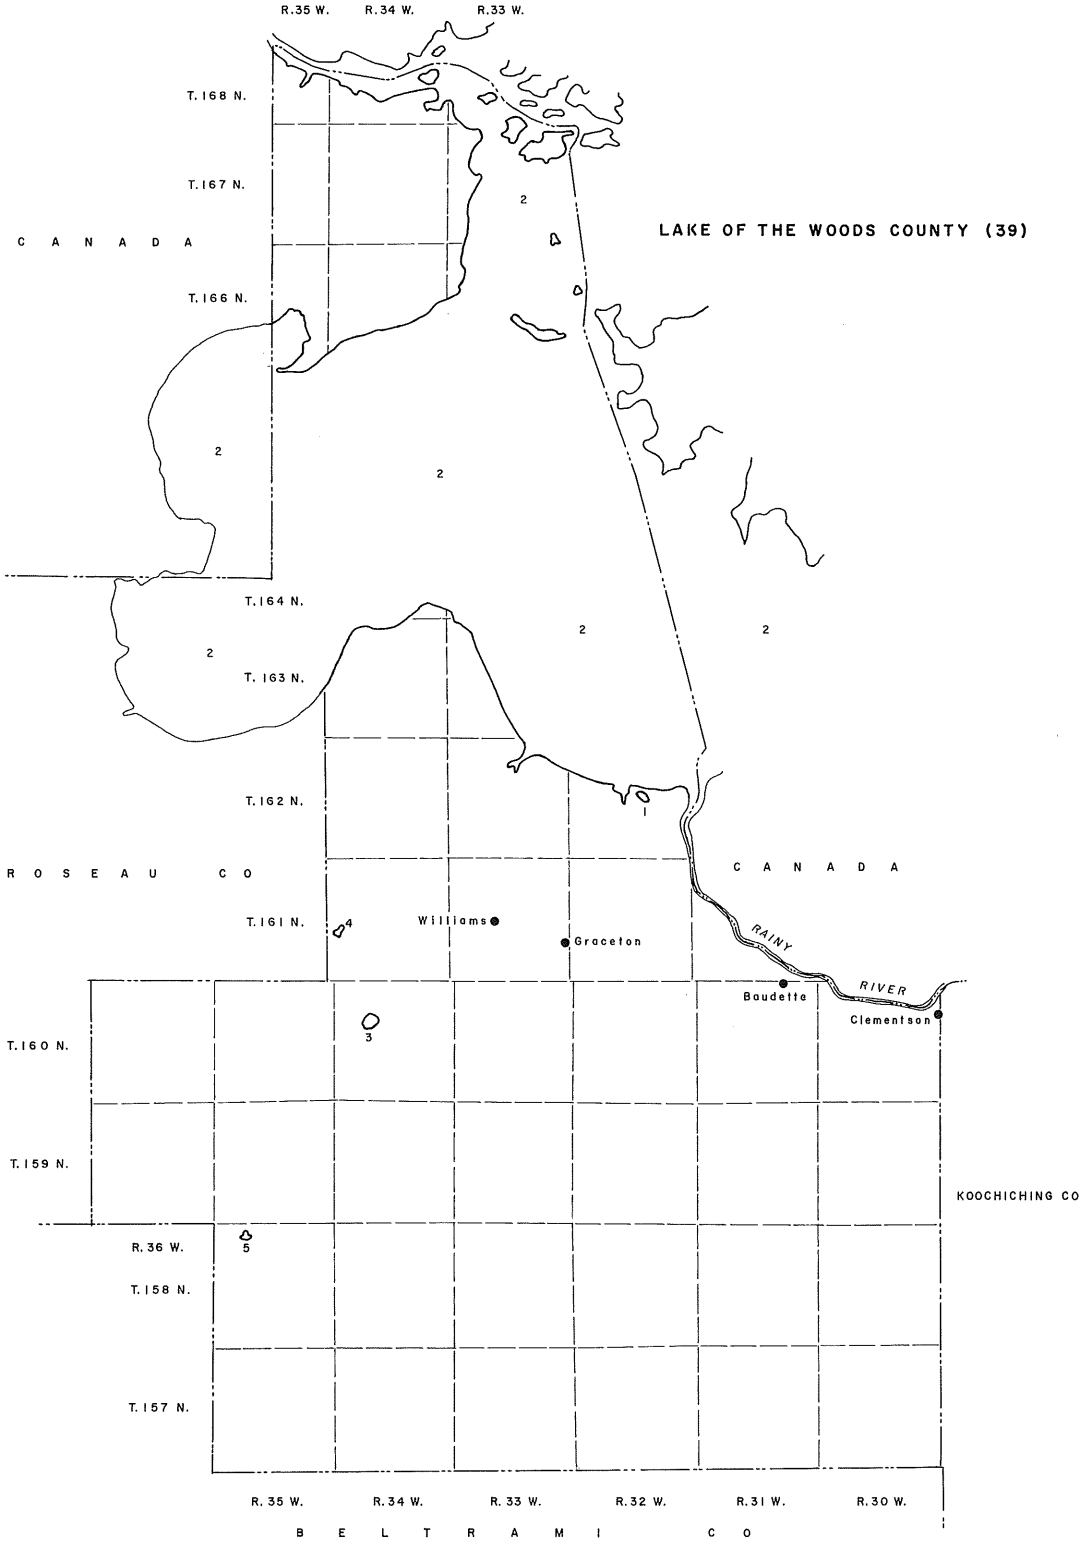

Although Lake of the Woods County contains only five lakes, it contains the largest lake area in the State. Lake of the Woods, 39-2, comprises over 99 percent of the lake area listed and this lake is mostly in Canada. Its total area is 950,400 acres, of which 317,010 acres are in Minnesota and 633,390 acres in Manitoba and Ontario. Lake of the Woods basin is primarily a bedrock basin, although Glacial Lake Agassiz once covered the entire county and deposited lake sediments over most of the bed. Lake of the Woods has been utilized as a reservoir for nearly 80 years.

In 1887-1888 the first attempt was made to control levels by constructing the Rollerway dam at the northwestern outlet of the basin. The Norman dam, which is located on the Winnipeg River one mile below the site of the Rollerway dam, was built in 1893-1895 by the Keewatin Power Company. It replaced the Rollerway dam in 1899. The present dam is owned by the Minnesota-Ontario Paper Company. Operating limits on levels of the Lake of the Woods reservoir have been established by the International Joint Commission.

LE SUEUR COUNTY (40)

Number of lakes 128
Lake area, acres. 22,172

The lakes in the county were formed mainly by the irregular deposition of glacial till and by ice blocks deposited in till. Many of the basins in the southern part of the county were formed by the irregular deposition of till.

In the northern part of the county, most were formed by ice blocks. Examples of each type of lake include the following: Emily, 40-124, and Jefferson, 40-92, were formed by the irregular deposition of till. Sanborn, 40-27, and Sasse, 40-40, were formed by ice blocks deposited in till. Tetonka, 40-31, and Upper Sakatah, 40-2, were formed by ice blocks deposited in outwash filling a preglacial valley. Jefferson, 40-92, the biggest lake in the county, has an area of 2,290 acres.

Other large lakes include Washington, 40-117, which has a total area of 1,565 acres and Tetonka, 40-31, which has an area of 1,336 acres.

Many of the basins are shallow and about 60 percent of them are affected by artificial drainage systems.

LE SUEUR COUNTY (40)

LINCOLN COUNTY (41)

Number of lakes [1] 110
Lake area, acres. 14,958

Most of the lake basins in the county were formed by the irregular deposition of glacial till; examples are Cottonwood, 41-15, and Anderson, 41-54. Benton, 41-43, the largest lake in the county was formed from ice blocks deposited in glacial till which filled a preglacial valley. A chain of northwest trending lake basins in the east-central part of the county, including the following numbered lakes, 41-34, 41-33, 41-36, and 41-23, were probably formed from ice blocks deposited in till along a preglacial valley.

Many of the county lakes are affected by artificial drainage systems.

Large lakes entirely within the county include: Benton, 41-43, 2,875 acres, Shaokotan, 41-89, 1,043 acres; Dead Coon, 41-21, 555 acres; and, Cottonwood, 41-15, 501 acres.

LINCOLN COUNTY (41)

LYON COUNTY (42)

Number of lakes 99
Lake area, acres 9,261

The Lyon County basins are mostly shallow depressions formed by the irregular deposition of glacial drift. More than half of the lakes have been affected by artificial drainage and many contain no water.

Coon Creek Marsh, 42-81, which has an area of 512 acres, is the largest basin in the county. Most of this basin was shown without water in 1951 aerial photographs.

Brawner Lake, 42-54, is a reservoir formed by a dam built across Judicial Ditch 9 by the Conservation Department in 1951-1952.

LYON COUNTY (42)

McLEOD COUNTY (43)

Number of lakes 117
Lake area, acres. 17,092

The lake basins in McLeod County were formed by the irregular deposition of glacial till and from ice blocks deposited in till. Basins formed by the irregular deposition of till occur mainly in the southern half of the county. Most of the basins in the northern part, particularly in the northwest, were formed from ice blocks deposited in glacial till. There are many artificial drainage systems in the county and about two-thirds of the basins are affected by drainage. Many of these basins contain very little water much of the time.

Cedar, 43-115, which is also in Meeker County, is the largest basin numbered in the county; it has a total area of 2,137 acres including 1,362 acres in McLeod County. Other large basins include: Otter, 43-85, 729 acres; Marion, 43-84, 616 acres; and Silver, 43-34, 500 acres.

Otter, 43-85, is a reservoir formed by a dam across the South Fork of the Crow River at Hutchinson. The original dam was built in 1857 for a flour milling operation. The reservoir presently is operated as a recreation pool. A meandered basin, Campbell Lake, was flooded by the reservoir when it was rebuilt by the city in 1939.

MC LEOD COUNTY (43)

MAHNOMEN COUNTY (44)

Number of lakes 264
Lake area, acres. 19,110

Many of the lake basins in the county were formed from ice blocks deposited in till. The map of Mahnomen County showing the distribution of lake basins indicates the majority of the basins are located in a band about 6 to 8 miles wide through Ranges 40 and 41, extending in a north-south direction through the center of the county. This is a hilly morainal region containing numerous ice block lake basins. On either side of this region are scattered basins formed mostly by the uneven distribution of glacial till. Several lake basins along the eastern edge of the county were formed by ice blocks deposited in glacial outwash which partly filled an old preglacial valley. Basins formed in this manner include: Long, 44-44; Double, 44-33, and Greer, 44-36, in the northeast corner of the county, and North Twin, 44-23; South Twin, 44-14; and Snider, 44-45, near the southeast corner of the county.

The largest lakes entirely within the county include the following: South Twin, 44-14, 1,072 acres; North Twin, 44-23, 946 acres; Bass, 44-6, 700 acres; and Snider, 44-45, 660 acres.

MAHNOMEN COUNTY (44)

MARSHALL COUNTY (45)

Number of lakes 7
Lake area, acres. 32,015

The entire county was once covered by Glacial Lake Agassiz which deposited a considerable thickness of lake sediments over the region. Except for Horseshoe, 45-7, the present lake basin formation was controlled by sedimentation from Lake Agassiz. Thief, 45-1, was formed behind a sandy ridge which acted as a natural dam ponding the waters. Mud, 45-2, and the smaller basins 45-3 through 45-6, associated with it were probably formed in depressions in the bed of Glacial Lake Agassiz which were not completely filled with sediment. All of these basins are shallow and surrounded by marshy terrain. Horseshoe, 45-7, is an oxbow lake basin formed by a meander of the Red River of the North.

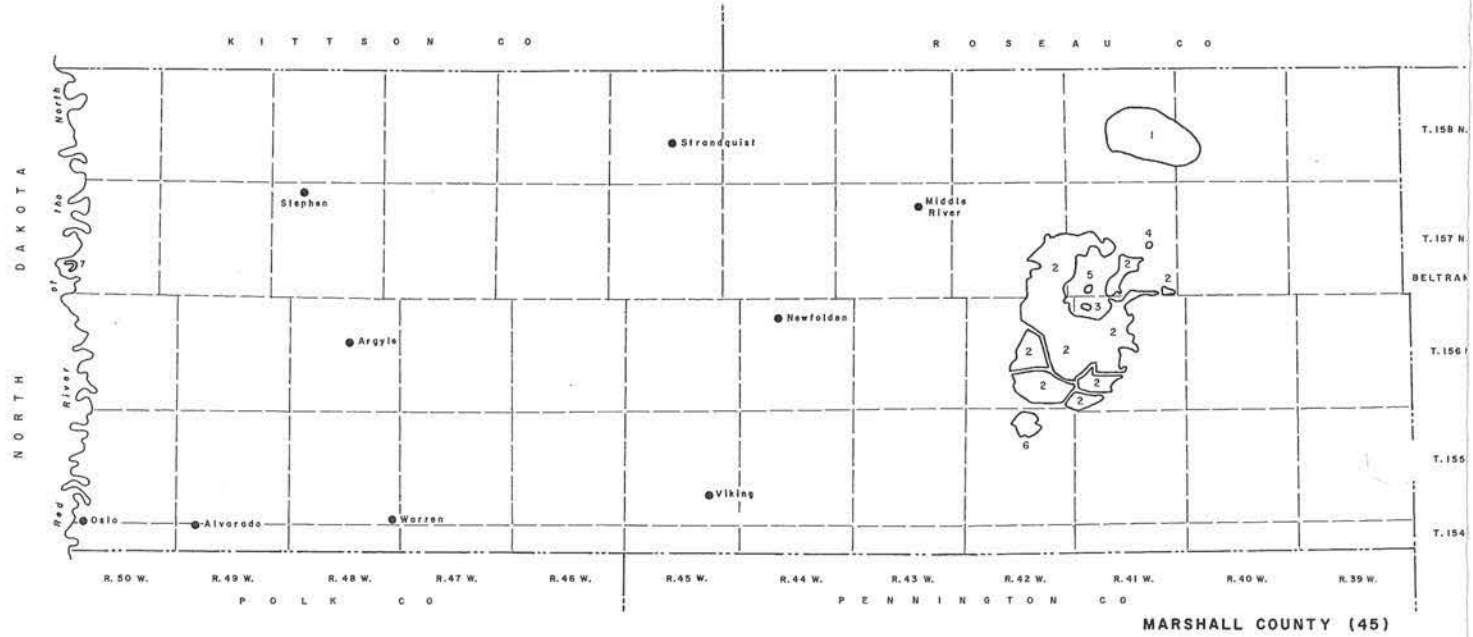

Thief, 45-1, is a State-owned wildlife refuge reservoir. A dam was constructed in 1930-1931 across Thief River to form the present impoundment.

Mud, 45-2, is a federal wildlife reservoir constructed in 1937-1938.

MARSHALL COUNTY (45)

MARTIN COUNTY (46)

Number of lakes [1] 149
Lake area, acres. 19,218

Most of the lake basins in the county were formed from ice blocks deposited in ground moraine. The orientation of many of the basins is generally in north-south trending chains, created by ice block depressions along preglacial valleys. Three distinct chains of basins formed in this manner are located in Ranges 29, 30 and 31. Another series of preglacial valleys is located in the northwestern part of the county, Townships 103 and 104, Ranges 31, 32 and 33. The pattern of ice block basins in this area indicates one valley extended in a north-south direction and includes lakes 46-145, 46-146, 46-147, 46-148, 46-121, 46-130, 46-133 and 46-120. Another valley which includes lakes 46-81, 46-82, 46-83, 46-84, 46-119, 46-117, 46-110, 46-112, 46-111 and 46-113 extended southwesterly from the northwest corner of Township 104, Range 31 to the southwest corner of Township 103, Range 32 where it intersected the former valley in the vicinity of McGowan Lake, 46-120. Several lake basins scattered between the chains of lakes were formed from ice blocks deposited in ground moraine.

Many of the lakes in the county are affected by artificial drainage systems.

The largest lake entirely within the county is Fox, 46-109, which has an area of 967 acres. Okamanpedan, 46-51, has an area of 2,205 acres, of which 1,270 acres are in Martin County and 932 acres in Iowa.

Other large lakes include: Cedar, 46-121, 726 acres; Bright, 46-52, 660 acres; Hall, 46-31, 552 acres; Pierce, 46-76, 548 acres; and Clayton, 46-61, 540 acres. Iowa Lake, 46-49, has a total basin area of 732 acres but 210 acres are in Iowa.

MARTIN COUNTY (46)

MEEKER COUNTY (47)

Number of lakes 208
Lake area, acres. 34,633

This county's lake basins were formed in a variety of ways. Many were formed from ice blocks deposited in glacial till and outwash or in both. Some were formed by the irregular deposition of till. The greatest concentration of lakes are found associated with a band of terminal moraine 3 to 6 miles wide, which extends southeastward from northeastern Kandiyohi County to south-central Meeker County and then northeastward into southwestern Wright County. Several linear northwest-southeast trending lakes and chains of lakes south of Grove City were probably formed by ice blocks deposited in preglacial valleys. In the area near Darwin and Litchfield, some of the basins were formed from ice blocks buried in an outwash plain.

Scattered lake basins located outside these areas were formed mainly by the irregular deposition of ground moraine.

Examples of lakes of different origin are given in the following table:

Origin	Ident. no.	Name	General location
Ice block basin in till.	47-46	Washington	Southeastern part of county
Ice block basin in till and outwash	47-50	Manuella	3 miles southwest of Darwin
Ice block basin in outwash	47-134	Ripley	2 miles south of Litchfield
Irregular deposition of till	47-153	King	Southwestern part of county
Ice block basin in till in a preglacial valley	47-177	Long	South of Grove City

Large lakes entirely within the County:

Ident. no.	Name	Area, acres
47-46	Washington	2,524
47-15	Jennie	1,089
47-134	Ripley	1,060
47-177	Long	872
47-38	Big Swan	772
47-95	Clear	703

The county contains many artificial drainage ditches which affect about 40 percent of the lakes.

MEEKER COUNTY (47)

MILLE LACS COUNTY (48)

Number of lakes 19
Lake area, acres 73,609

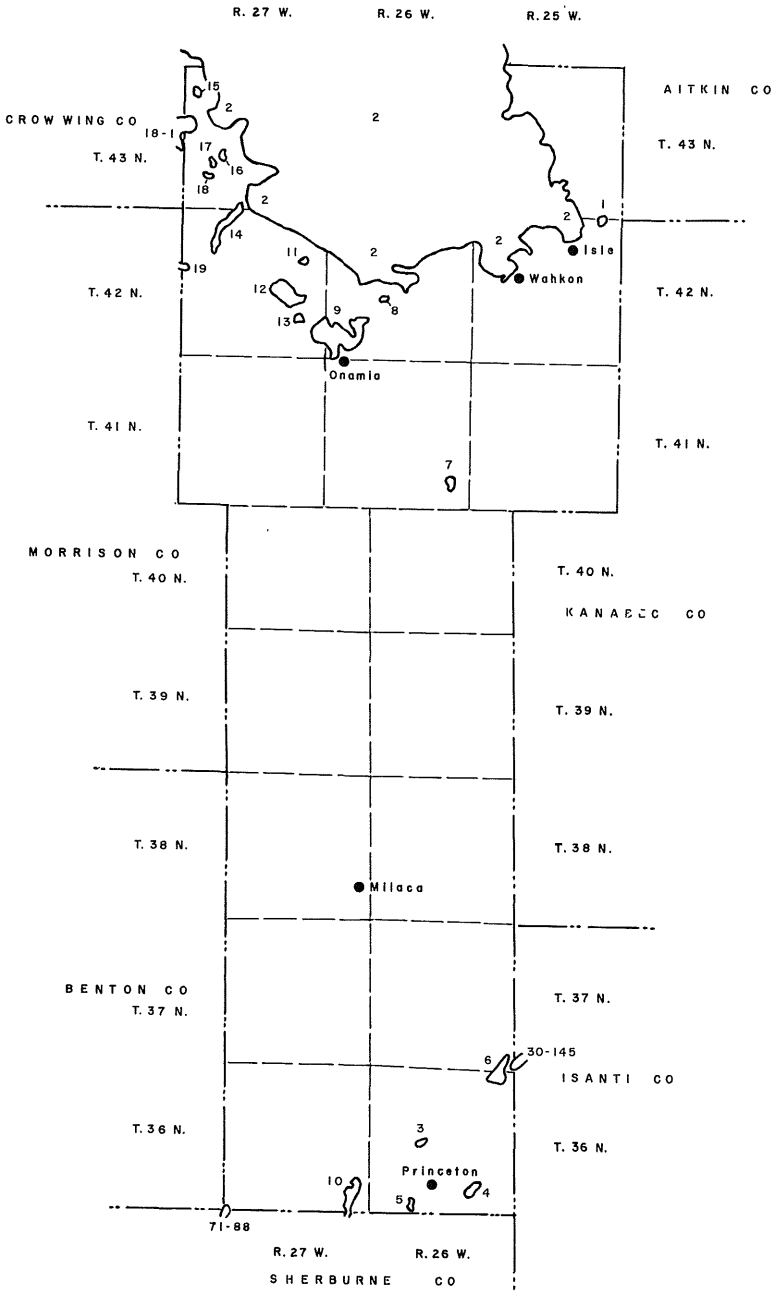

The lakes in Mille Lacs County are located only in the northern and southeastern parts of the county. Mille Lacs, 48-2, which is the largest in the county, was formed by the damming action of a prominent morainal ridge which extends along the southern end of the basin. The smaller basins located south of Mille Lacs were formed by ice blocks deposited in the glacial till along this moraine. The small basins at the southeastern edge of the county are basins probably formed from ice blocks deposited in a preglacial valley that extended northeastward into Isanti County.

MILLE LACS COUNTY (48)

MORRISON COUNTY (49)

Number of lakes 140
Lake area, acres. 15,204

Ice blocks deposited in glacial till formed many of the lake basins in the county. Alexander, 49-79, the largest basin in the county, is a moraine dam basin formed by the damming action of a large moraine which extends around the western, southern, and eastern edges of the basin. The numerous lake basins located along this moraine in the northwestern part of the county represent ice block depressions in glacial drift. The basins in the southwestern part of the county are of similar origin. Long, 49-86, and Pine, 49-81, were probably formed by ice blocks deposited in a till-filled preglacial valley. East of the Mississippi River, the lake basins were formed by ice blocks deposited in till, Sullivan, 49-16, and in outwash, Skunk, 49-26.

Large lakes entirely within the county are:

Ident. no.	Name	Area, acres
49-79	Alexander	2,990
49-127	Shamineau	1,453
49-137	Fish Trap	1,320
49-16	Sullivan	1,199

Sylvan, 49-36, is a hydropower storage reservoir operated by Minnesota Power and Light Company. The basin was formed by a dam built across the Crow Wing River near Sylvan in 1910-1912.

Placid, 49-80, is another hydropower storage reservoir operated by Minnesota Power and Light Company. The reservoir was formed by a dam built across the Crow Wing River near Pillager in 1916-1917.

MORRISON COUNTY (49)

MOWER COUNTY (50)

Number of lakes 4
Lake area, acres 143

There are no natural lake basins in this county, primarily because it was only very lightly glaciated. There are, however, four small artificial lakes formed by dams on the Upper Iowa and Cedar Rivers and on Dobbins Creek.

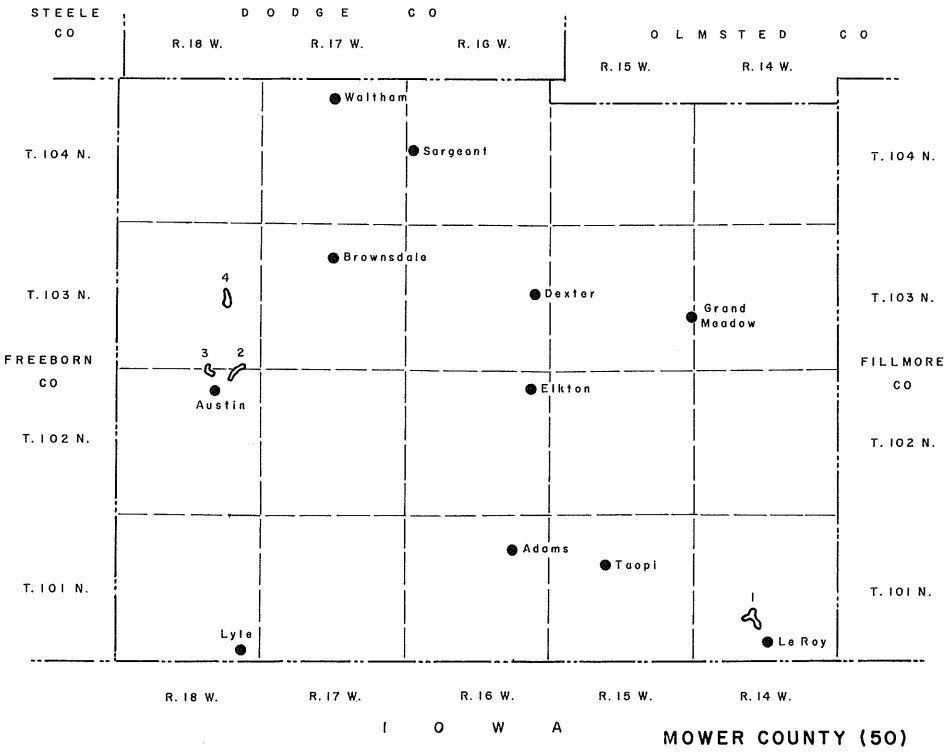

Reservoirs in Mower County

Ident. no.	Name	Location of dam	Remarks
50-1	Mill pond	Upper Iowa River at Leroy	Former mill reservoir dam originally built in 1855.
50-2	East side	Dobbins Creek at Austin	Former mill reservoir dam originally built in 1858.
50-3	Mill pond	Cedar River at Austin	Original dam built in 1853. Former meat-packing plant hydroreservoir now used to pond water for municipal power plant.
50-4	Ramsey mill pond	Cedar River at Ramsey	Former flour mill reservoir. Original dam built in 1872-73. Now used as recreation reservoir.

MOWER COUNTY (50)

MURRAY COUNTY (51)

Number of lakes 100
Lake area, acres. 17,634

The majority of lakes in the county are in shallow basins formed by the irregular deposition of glacial till in ground moraine. About two-thirds of the lakes are affected by artificial drainage systems.

Shetek, 51-46, is a moraine dam lake formed by a terminal moraine which extends along the southern and eastern edges of the basin. A chain of lakes, extending southeastward from the vicinity of Dovray in the east-central part of the county, indicates these lakes occupy ice block basins along a preglacial drainageway.

Large county lakes are shown in the table below.

Ident. no.	Name	Area, acres
51-46	Shetek	3,596
51-74	Great Oasis	1,466
51-63	Sarah	1,176
51-78	Bear	1,110
51-77	Rush	849
51-80	Oscar	547
51-62	Maria	425

MURRAY COUNTY (51)

NICOLLET COUNTY (52)

Number of lakes 51
Lake area, acres. 17,014

Nicollet County lake basins were formed by the irregular deposition of glacial till in ground moraine. The resulting lakes are shallow and many of them have been severely affected by artificial drainage systems.

There are four large lakes in the county:

Ident. no.	Name	Area, acres
52-34	Swan	9,346
52-23	Middle	2,186
52-13	Timber	974
52-9	Goose	713

NICOLLET COUNTY (52)

NOBLES COUNTY (53)

Number of lakes[1] 44
Lake area, acres. 7,222

The lake basins in Nobles County were formed primarily by two processes; by the irregular deposition of till and by ice blocks deposited in till. The basins in the northeastern corner of the county, mostly in Township 104 North, Range 39 West, were formed by the uneven distribution of glacial till in ground moraine. The series of basins extending in a north-south direction down the middle of the county were formed by ice blocks deposited in glacial drift of a terminal moraine in the northeast corner of the county.

Okabena, 53-28, and Ocheda, 53-24, and most of the smaller basins in the Worthington area were formed from ice blocks deposited in glacial sediments which filled preglacial valleys.

More than 80 percent of the lakes in the county are affected by artificial drainage and do not contain water much of the time.

There are only four large lakes: Ocheda, 53-24, 1,778 acres; Okabena, 53-28, 785 acres; West Graham, 53-21, 526 acres; and East Graham, 53-20, 523 acres.

NOBLES COUNTY (53)

NORMAN COUNTY (54)

Number of lakes 18
Lake area, acres. 415

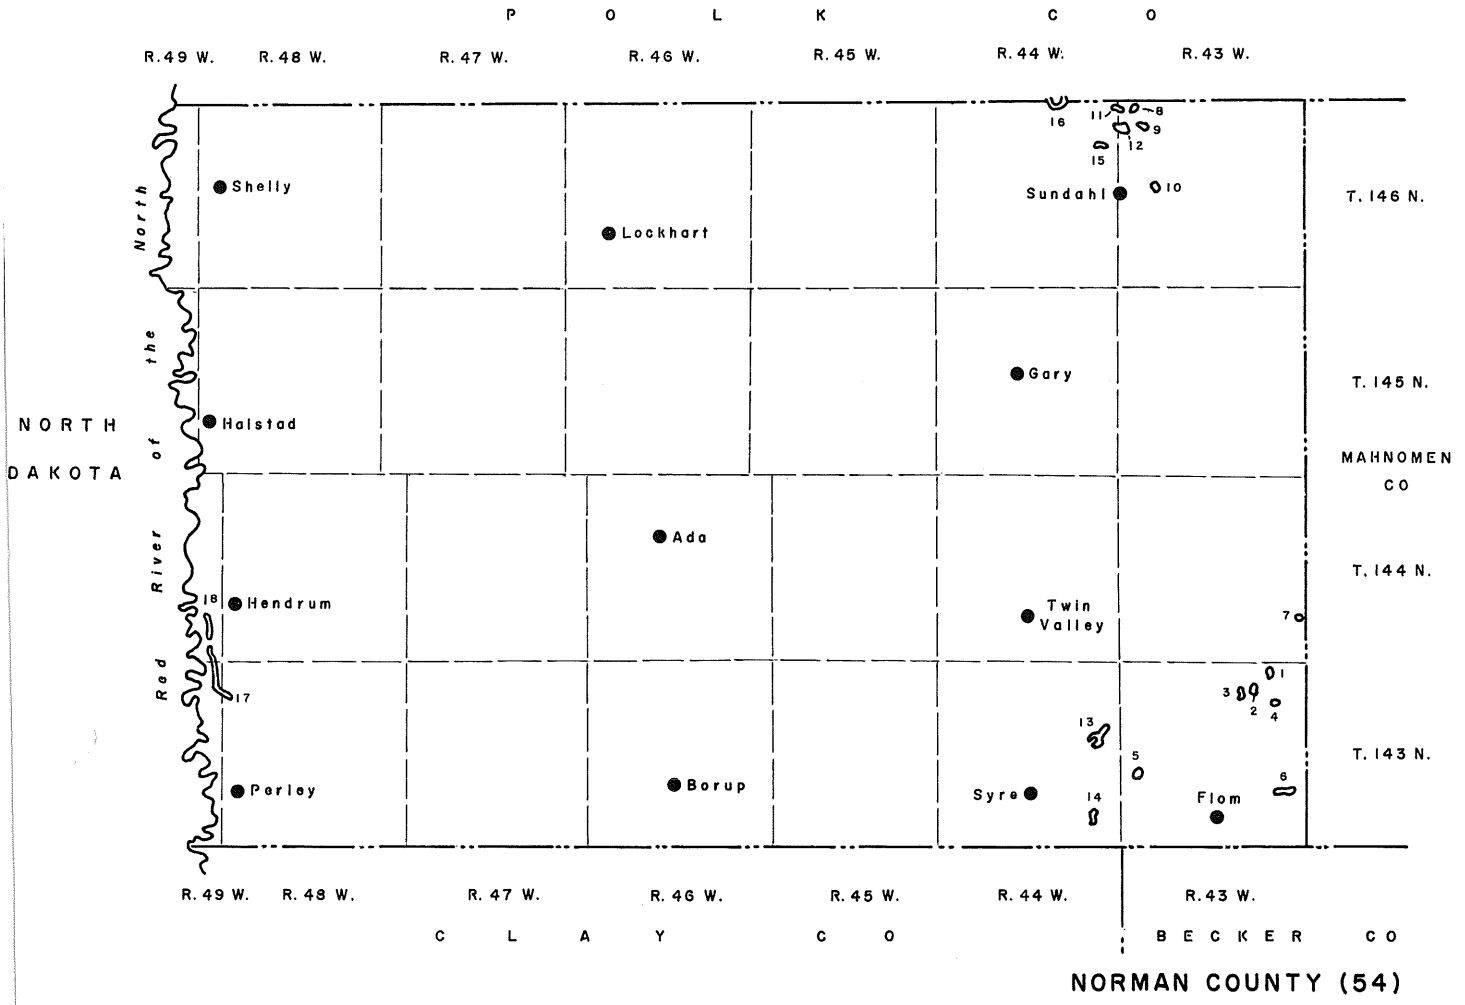

The lake basins in the northeastern part of the county, north of Sundahl, were formed by ice blocks deposited in a weak morainal region which later was inundated by Glacial Lake Agassiz.

The basins in the southeastern part of the county were formed by the irregular deposition of glacial till. Love, 54-17, and an unnamed basin, 54-18, located along the Red River of the North, south of Hendrum, are in the valley of a small tributary of the Red River of the North. The origin of these basins is not clear, although they appear to be covered by sediment deposited as a partial dam across a recent stream valley. There are no large lakes in the county.

NORMAN COUNTY (54)

OLMSTED COUNTY (55)

Number of lakes 5
Lake area, acres. 776

Since Olmsted County was only lightly glaciated, there are no natural lake basins in this area. Five artificial reservoirs created by dams across the South and Middle Forks Zumbro River and the Root River are the only lakes in the county.

Reservoirs in Olmsted County

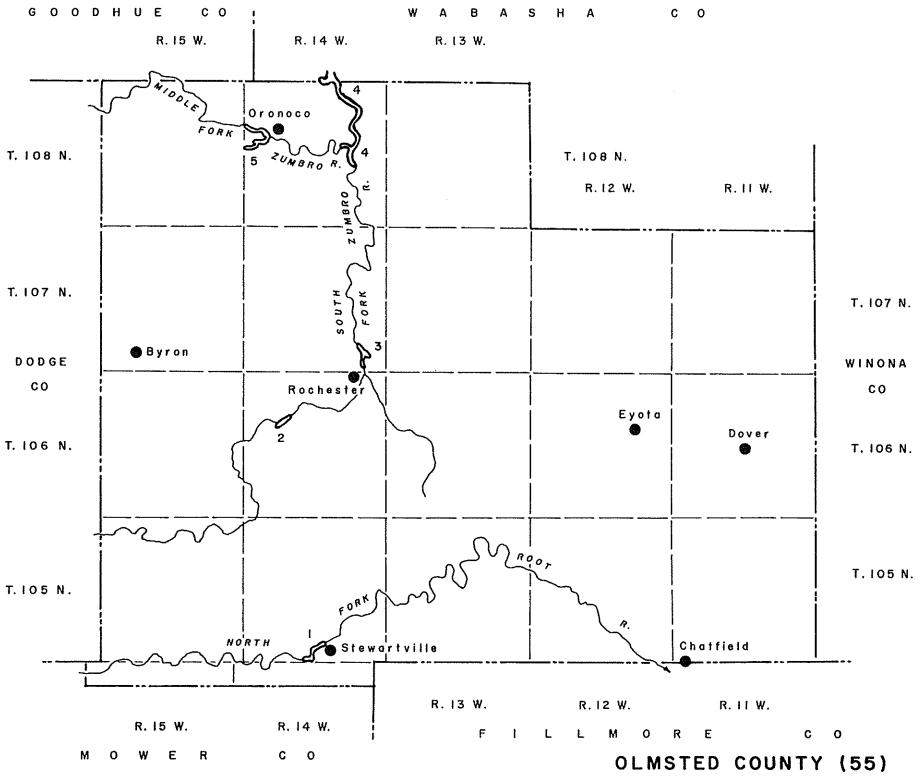

Ident. no.	Name	Location of dam	Remarks
55-1	Florence	North Fork Root River at Stewartville	Former flour mill reservoir. Original dam built in 1857. Now a recreation reservoir for Stewartville Village.
55-2	Mayowood	South Fork Zumbro River near Rochester	Recreation reservoir built by private interests in early 1930's.
55-3	Silver	South Fork Zumbro River at Rochester	Former flour mill reservoir. Original dam built in 1855-56.
55-4	Zumbro	South Fork Zumbro River near Oronoco	Municipal hydroelectric storage reservoir built in 1919. Owned and operated by City of Rochester.
55-5	Shady	Middle Fork Zumbro River at Oronoco	Former flour mill reservoir. Original dam built in 1854. Now maintained for recreational use.

OLMSTED COUNTY (55)

OTTER TAIL COUNTY (56)

Number of lakes 1,048
Lake area, acres. 173,851

Otter Tail County has the largest number of lakes in Minnesota. The county is covered with great thicknesses of complex glacial deposits and consequently contains numerous lake basins of different origins. The following examples illustrate the origin of various lakes:

Origin	Ident. no.	Name	Remarks
Ice block basins in till	56-385	Star	In hilly morainal areas mainly in
	56-747	Lida	western half of county.
	56-481	West Lost	
	56-589	Mineral	
Ice block basins in till-filled	56-950	Olaf	Scattered throughout western
preglacial valleys	56-379	North Turtle	half of county.
	56-957	Upper Lightning	
Ice block basins in outwash	56-130	Big Pine	In central part of eastern half and
plains	56-141	Rush	in western half from T. 137 N., R.
	56-242	Otter Tail	43 W., to T. 133 N., R. 40 W.
	56-786	Pelican	
Ice block basins in outwash-	56-200	Donalds	Chain of lakes in east half of
filled preglacial valleys	56-114	West Leaf	county in Ts. 133 and 134 N.,
	56-116	East Leaf	Rs. 38-40 W.
Ice block basins in till and	56-760	Lizzie	At margins of morainal areas and
outwash	56-877	Jewett	outwash plains in western half
	56-437	Stalker	of county.
Irregular deposition of till	56-14	Mud	Northeastern and southeastern
	56-5	West Annalaide	corners of east half of county.

Lakes of 2,000 acres or more in area

Ident. no.	Name	Area, Acres
56-242	Otter Tail	13,845
56-383	Dead	7,827
56-747	Lida	7,277
56-239	West Battle	5,672
56-141	Rush	5,340
56-130	Big Pine	4,834
56-385	Star	4,809
56-786	Pelican	4,314
56-760	Lizzie	4,145
56-386	Big McDonald	3,096
56-238	Clitherall	2,522
56-138	East Battle	2,360
56-142	Little Pine	2,036

There are 14 other lakes which have areas ranging from 1,000 to 2,000 acres.

Reservoirs in Otter Tail County

Ident. no.	Name	Dam location	Remarks
56-480	Leon	Otter Tail River at Phelps	Flour mill reservoir. Original dam built in 1873.
56-782	Hoot	Otter Tail River near Fergus Falls	Storage reservoir built in 1913-1914. Operated by Otter Tail Power Company. Hoot Lake Hydroelectric Station.
56-821	Unnamed	Otter Tail River near Fergus Falls	Storage reservoir built in 1918. Operated by Otter Tail Power Company. Pisgah Hydroelectric Station.
56-824	Dayton	Otter Tail River near Fergus Falls	Original dam built in 1870's. Storage reservoir operated by Otter Tail Power Co. Dayton Hollow Hydroelectric Station.
56-888	Unnamed	Pelican River at Elizabeth	Original mill dam built before 1878.
56-920	Unnamed	Pelican River at Pelican Rapids	Originally flour mill reservoir built in 1870.
56-945	Orwell	Otter Tail River near Breckenridge	Federally operated reservoir for flood control, water supply and recreation. Placed in operation by U.S. Corps of Engineers in 1952.

OTTER TAIL COUNTY (56)
(EAST PART)

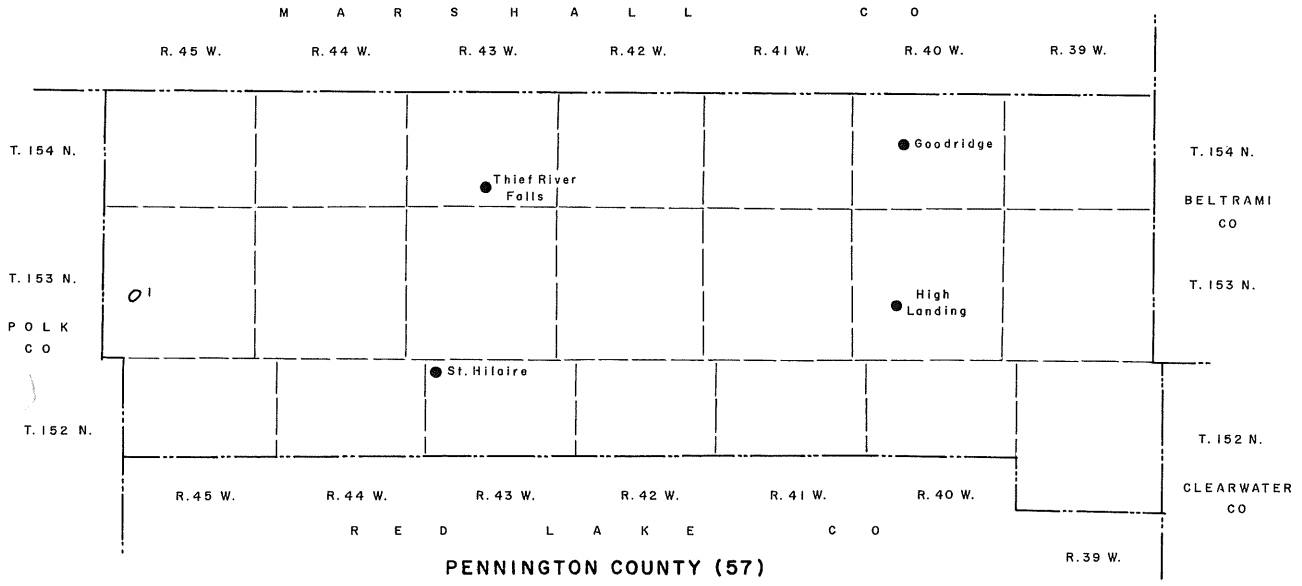

OTTER TAIL COUNTY (56)
(WEST PART)

PENNINGTON COUNTY (57)

Number of lakes 1
Lake area, acres. 35

The entire surface of this county represents a lake plain formed by Glacial Lake Agassiz. Goose Lake, 57-1, is the only lake in the county. This basin was formed artificially in a low marshy area bounded by a glacial beach ridge on its western edge.

Ident. number	Name	Location Range	Township	Section	Area in Acres	Meandered	Remarks
57-1	Goose	45	153	19,20	35	. . .	

PINE COUNTY (58)

Number of lakes [1] 142
Lake area, acres. 11,596

The lake basins in Pine County were formed mainly from ice blocks deposited in till or outwash. Cross, 58-119, occupies a bedrock fault depression created by the "Douglas Fault" which trends northeast-southwest across the county. This basin is oriented along the fault zone, with the western shore located in glacial till and the eastern part in older lava flows, which represent the upthrust side of the fault.

Grindstone, 58-123, is one of the deepest lake basins in Minnesota with a maximum depth of more than 150 feet. Its basin was scoured out by glacial erosion of a pre-glacial bedrock valley formed in the Hinckley Sandstone. This particular area did not receive extensive glacial deposition; consequently it was not filled with glacial sediments and has remained a deep basin.

Lake basins formed by ice blocks deposited in till include Pokegama, 58-142; and Oak, 58-48. Sturgeon, 58-67, was formed by ice blocks deposited in till and outwash.

The largest lakes in the county are Pokegama, 58-142, 1,621 acres; Sturgeon, 58-67, 1,456 acres; Cross, 58-119, 1,013 acres; Island, 58-62, 582 acres; and Grindstone, 58-123, 520 acres. There are three artificial lakes in the county, all owned by the State of Minnesota. Stanton Reservoir, 58-111, was formed by a dam constructed across the Willow River near the Village of Willow River in 1940-1941. Grindstone River Reservoir, 58-121, was formed by a dam constructed across the Grindstone River near Hinckley in 1932. Hinckley Ponds, 58-122, consisting of three small connected fish-rearing ponds, were constructed by the State Conservation Department in 1935 and 1948.

PINE COUNTY (58)

PIPESTONE COUNTY (59)

Number of lakes 1
Lake area, acres. 80

There are no natural lakes in the county. Split Rock, 59-1 is an artificial recreation reservoir constructed in 1936-37 at Split Rock State Park near Ihlen. It was formed by a dam built across Split Rock Creek.

Ident. number	Name	Location			Area in Acres	Meandered	Remarks
		Range	Township	Section			
59-1	Split Rock	46	105	15,22	80	. . .	Reservoir.

PIPESTONE COUNTY (59)

POLK COUNTY (60)

Number of lakes 332
Lake area, acres. 18,242

The lakes in Polk County are all located in the moraine and glacial till plain areas in the eastern two-thirds of the county. The western one-third and northeastern corner of the county is in the old bed of Glacial Lake Agassiz. It is covered with glacial lake sediments and contains no lakes.

Most of the lake basins in the county were formed from ice blocks deposited in glacial till. Examples of basins formed by ice blocks are Turtle, 60-32; Union, 60-217; and Oak, 60-185.

Some basins were formed by the irregular deposition of glacial till. Uff, 60-119 is an example.

The largest lakes located entirely in Polk County include: Maple, 60-305, 1,445 acres; Union, 60-217, 910 acres; and Turtle, 60-32, 605 acres. Sand Hill, 60-69, is another large lake, total area 598 acres, but 100 acres is in Mahnomen County.

POPE COUNTY (61)

Number of lakes 216
Lake area, acres. 34,731

The majority of lakes in this county were formed by ice blocks deposited in glacial terminal moraine and outwash. Minnewaska, 61-130, the largest lake in the county, occupies a steep-sided ice block depression in moraine, with a broad outwash deposit issuing from its northeast corner in the vicinity of Glenwood. The following table summarizes types of basins and examples:

Origin	Ident. no.	Name	General location
Ice block basins in till	61-6	Johanna	Throughout most of the county
Ice block basins in till in pre-glacial valleys	61-180 61-29	Emily Westport	T. 124 N., Rs. 39, 40 W. Ts. 125, 126 N., R. 36 W.
Ice block basins in till and outwash	61-130 61-23	Minnewaska Grove	Near center and along east-central part of county
Ice block basins in outwash	61-51 61-48	Swenoda Round	Ts. 123, 124 N., Rs. 36, 37 W., southeastward from Glenwood into Stearns County
Ice block basins in outwash in pre-glacial valleys	61-33 61-67	West Ellen Villard	In north-south chain in northeast part of county near Villard
Irregular deposition of till	61-20 61-86	Lincoln Ramuson	In scattered areas of till throughout the county

RAMSEY COUNTY (62)

Number of lakes [1] 83
Lake area, acres [2] 10,871

The lake basins in the county were formed primarily from ice blocks deposited in glacial till. Many of the ice block basins are localized in preglacial drainageways which were filled with glacial sediments. One of these buried valleys extends from White Bear, 82-167, southwestward to Gervais Lake, 62-7, and then turns southeastward to Pigs Eye, 62-4. The following lakes, listed by number from north to south, were formed by ice blocks deposited in this valley: 62-34, 62-35, 62-37, 62-40, 62-6, 62-7, 62-10, 62-12, 62-13, and 62-4.

Another series of ice block basins occurs in a preglacial valley which joins the previously mentioned valley from the northwest. Lakes in this valley include: Marsden, 62-59; Snail, 62-73; Grass, 62-74; Round, 62-9; and Savage, 62-8. This valley intersects the other valley at Gervais, 62-7.

Another buried valley extends from the vicinity of New Brighton into St. Paul, entering the city limits of St. Paul near McCarron, 62-54, southeast of Roseville. Other lakes in this valley include: 62-70, 62-71, 62-78, and 62-57. Long, 62-67 and Pike, 62-69, are basins which are in a smaller buried valley which intersects this valley from the northwest at Johanna, 62-78.

The largest lake entirely within the county is Pleasant, 62-46, which has an area of 585 acres. Another large lake which extends into adjacent counties is Bald Eagle, 62-2, covering a total area of 1,046 acres including 849 acres in Ramsey County.

RAMSEY COUNTY (62)

RED LAKE COUNTY (63)

Number of lakes 2
Lake area, acres. 68

All of the topography of Red Lake County is composed of a lake plain that was deposited by Glacial Lake Agassiz. It contains only one natural lake, Huot Slough, 63-2, which is an elbow lake formed by a meander cutoff of the Red Lake River. Another lake, 63-1, is an artificial basin which is part of a wildlife area.

Ident. number	Name	Location Range	Township	Section	Area in Acres	Meandered	Remarks
63-1	.....	45	151	21	45	...	Artificial
63-2	Huot Slough	45	151	28	23	...	

RED LAKE COUNTY (63)

REDWOOD COUNTY (64)

Number of lakes 133
Lake area, acres. 7,206

Redwood County contains many small shallow lake basins. These basins were formed primarily by the uneven distribution of till in ground moraine, and nearly all of them are affected by artificial drainage systems.

East Three, 64-33, which has an area of 234 acres, and West Three, 64-34, which has an area of 222 acres, are the largest lakes in the county.

REDWOOD COUNTY (64)

RENVILLE COUNTY (65)

Number of lakes 144
Lake area, acres. 10,592

The gently rolling surface of Renville County was created by the deposition of ground moraine. Lake basins in such areas usually originate from the irregular deposition of till, and are typically shallow. Nearly all of the lakes in this county are affected by artificial drainage systems.

Long, 65-100, and Lee, 65-102, were formed by ice blocks deposited in till, probably in preglacial valleys. Another chain of lakes in the northeastern corner of the county was formed by ice blocks deposited in till along a buried preglacial valley. Lakes in this chain include Preston, 65-2, Allie, 65-6, and Boon, 65-13.

Boon, 65-13, is the largest lake in the county; it has an area of 858 acres total, including one acre in Meeker County.

The following table lists other large lakes entirely in Renville County:

Ident. no.	Name	Area, acres
65-2	Preston	678
65-6	Allie	510
65-100	Long	443

Fox, 65-78, has a total area of 1,078 acres, but 375 acres of its area are in Kandiyohi County.

RENVILLE COUNTY (65)

RICE COUNTY (66)

Number of lakes 65
Lake area, acres. 13,448

Lake basins in Rice County were formed by: the irregular deposition of till, French, 66-38; ice block basins in till, Circle, 66-27; and ice blocks deposited in outwash-filled preglacial valleys, Cannon, 66-8.

About 50 per cent of the lakes are affected by artificial drainage systems.

ROCK COUNTY (67)

Number of lakes 2
Lake area, acres. 29

There are no natural lake basins in this county, primarily because it did not undergo glaciation during the latest Wisconsin glacial stage. The two basins listed are artificial recreation reservoirs formed by dams built by the Works Progress Administration across Mound Creek in 1935-37. The reservoirs are located in Blue Mounds State Park.

Ident. number	Name	Location Range	Township	Section	Area in Acres	Meandered	Remarks
67-1	North Mound Springs	45	103	13	10	. . .	Reservoir.
67-2	South Mound Springs	45	103	24	19	. . .	Do.

ROSEAU COUNTY (68)

Number of lakes 3
Lake area, acres. 6,924

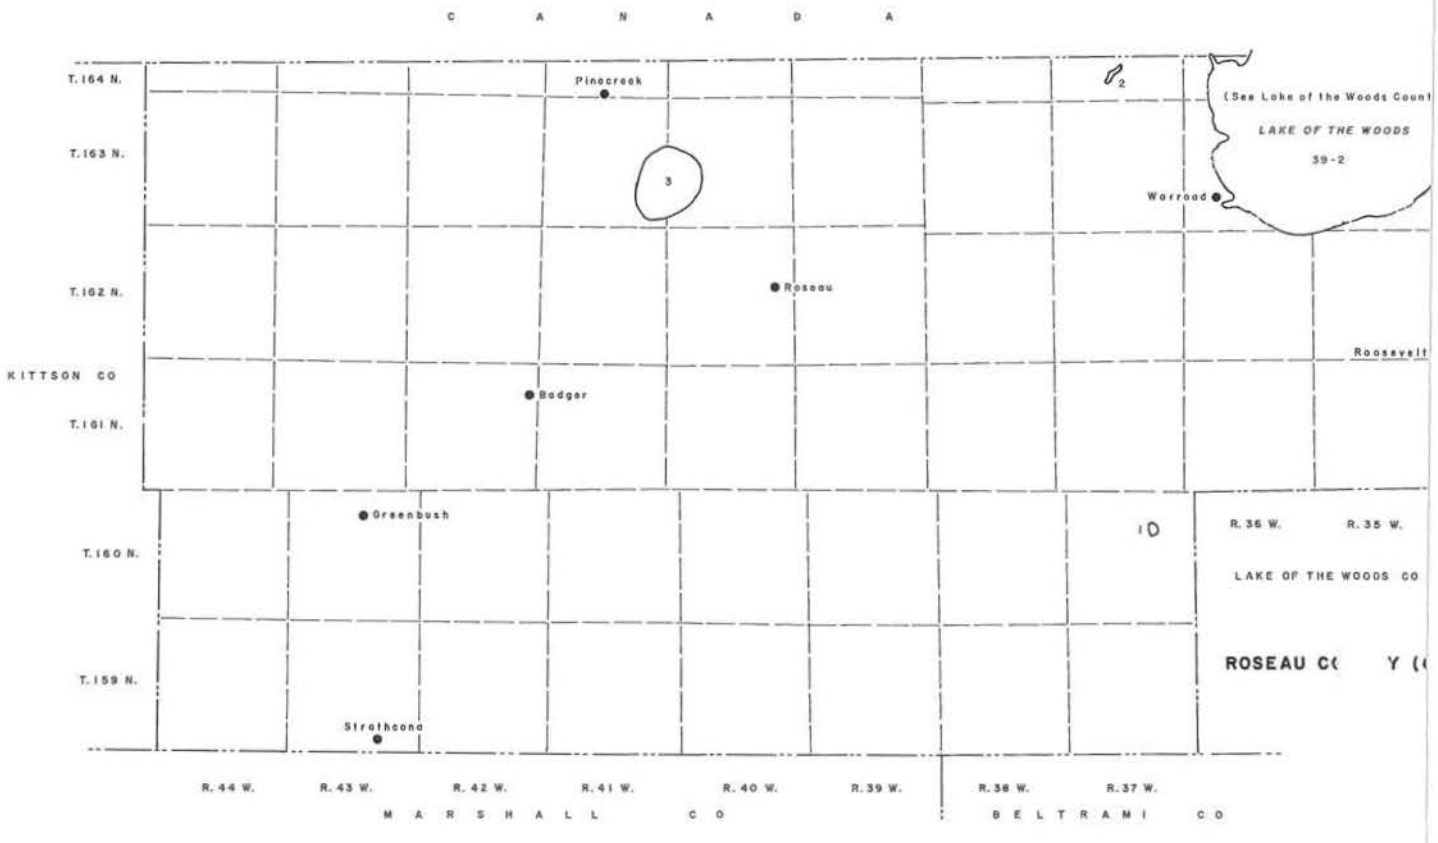

The entire county was once covered by Glacial Lake Agassiz and consequently is covered by sediments deposited in the lake.

The three lakes listed in Roseau County are in minor depressions in the old Lake Agassiz bed. These basins reflect the surface of the underlying glacial drift buried beneath the glacial lake clays.

ST. LOUIS COUNTY (69)

Number of lakes [1]	939
Lake area, acres (except Lake Superior)	337,632
Lake Superior area adjacent to St. Louis Co.	70,800

In number of lakes, St. Louis County ranks third among the counties of Minnesota. Practically all of the lakes shown on the map of the north half are in bedrock basins formed by glacial erosion. Typical examples are Namakan, 69-693; Burntside, 69-118; and Trout, 69-498. Several large lakes, including Pelican, 69-841, and Vermilion, 69-378, are in bedrock basins which were partially dammed by glacial drift along the southern edges of the basins. Big Rice, 69-669, and the series of small lakes in Townships 60 and 61 North, Ranges 12 through 18 West, were formed from ice blocks deposited in till.

Most of the lake basins in the southern half of the county were formed from ice blocks buried in drift, or from the irregular deposition of till. A series of lakes located near Aurora resulted from ice blocks in bedrock basins localized along a glacial drainageway. Lakes in this valley include Wynne, 69-434; Embarrass, 69-496; and Cedar Island, 69-568.

Evidence of lake sediments deposited by two extinct glacial lakes is found in this county. Glacial Lake Agassiz once occupied a large area north of the Mesabi Range in the region now generally drained by the Little Fork River.

South of the Mesabi Range, in the vicinity of Floodwood, Toivola, and Cotton, is a low swampy terrain practically devoid of lakes, which once formed the bed of Glacial Lake Upham.

The following table summarizes types of basins formed by glacial deposition or other means in the southern half of St. Louis County.

Origin of basin	Ident. no.	Name
Irregular deposition of till	69-41	Bassett
	69-371	Wild Rice
Ice blocks deposited in till	69-511	Grand
	69-939	Sturgeon
Ice blocks deposited in outwash	69-249	Colby
Formed by excavation during mining activity	69-428	St. James Pit

St. Louis County has 51 lakes with areas of more than 500 acres which are located entirely within the county. There are 27 lakes from 500 to 1000 acres in size. Ten lakes have areas of 1000 to 2000 acres and 14 lakes exceed 2000 acres in area. The 14 largest lakes entirely within county boundaries are listed in the following table:

Ident. no.	Name	Area, acres
69-378	Vermilion	49,110
69-841	Pelican	11,944
69-118	Burntside	10,236
69-498	Trout	9,237
69,372	Island	8,280
69-375	Whiteface	4,980
69-373	Boulder	4,450
69-616	Crane	3,396
69-491	Fish	3,260
69-115	Bear Island	2,667
69-69	Shagawa	2,639
69-371	Wild Rice	2,133
69-669	Big Rice	2,072
69-190	Big	2,049

[1] Includes four lakes which are mostly in Canada.

There are 13 reservoirs in the county including 6 which are located along the Minnesota-Canada border.

Reservoirs in St. Louis County

Ident. No.	Name	Area in acres[2]	Year Built	Remarks
69-371	Wild Rice	2,133	1909	Water power storage reservoirs owned by Minnesota Power and Light Company
69-372	Island	8,280	1909	
69-491	Fish	3,260	1911	
69-373	Boulder	4,450	1920	
69-375	Whitefish	4,980	1923	
69-694	Rainy	29,791 (220,800)	1909	Dam, located at International Falls, is owned and operated by three Minn-Canadian companies. Levels regulated by International Joint Commission.
69-693	Namakan	14,050 (28,260)	1914	Two dams, located at Kettle Falls, are owned and operated by three Minn-Canadian companies. Levels regulated by International Joint Commission.
69-617	Sand Point	5,680 (8,890)	--	Part of Namakan reservoir system controlled by dams at Kettle Falls.
69-608	Little Vermilion	540 (1,331)	--	
69-616	Crane	3,396	--	
69-845	Kabetogama	24,800 (25,760)	--	
69-580	Pike River	241	1912	Built by Tower City as power dam. Now privately owned.
69-249	Colby	514	1956	Built by Erie Mining Co. Water supply reservoir for taconite mining.

[2] Figures in parentheses indicate total area if part of reservoir is also located in Canada.

In addition to the large lakes entirely within the county, there are 11 other large lakes which are located partly within Canada or adjoining counties.

Ident. No.	Name	Area, acres in St. Louis County	Total
69-694	Rainy*	29,791	220,800
69-845	Kabetogama	24,800	25,760
69-224	Lac La Croix*	19,820	34,070
69-693	Namakan*	14,050	28,260
69-617	Sand Point*	5,680	8,890
69-3	Birch	5,000	7,628
69-470	Loon*	2,589	3,101
69-121	Iron*	1,680	2,298
69-939	Sturgeon	1,624	2,050
69-2	Seven Beaver	1,488	1,508
69-608	Little Vermilion	540	1,331

*Canadian-Minnesota boundary water.

ST. LOUIS COUNTY (69)
(SOUTH HALF)

SCOTT COUNTY (70)

Number of lakes 144
Lake area, acres. 15,407

The lake basins in Scott County were formed primarily from ice blocks deposited in glacial terminal moraine. Some basins were also formed by the irregular deposition of till and some were formed in the flood plain of the Minnesota River Valley. The following table summarizes the origin and distribution of types of lakes found in the county.

Origin	General location	Ident. No.	Name
Irregular deposition of till	Southeast corner of county, T. 113 N., Rs. 24, 25 W.	70-139	Clarks
Ice block basins deposited in till	Throughout county except river valley and southwest corner	70-91 70-98	Cedar Pleasant
Ice block basins deposited in till-filled preglacial valleys	Ts. 114, 115 N., Rs. 21 and 22	70-26 70-72 70-54	Lower Prior Upper Prior Spring
Flood plain lake basins formed by natural levees	Along Minnesota River Valley	70-87 70-118	Fisher Gifford
Oxbow basins formed by cutoff meanders of Minnesota River	Minnesota River Valley, T. 114 N., R. 24 W.	70-134	Horseshoe

Large lakes in Scott County include Lower Prior, 70-26; 820 acres; Cedar, 70-91, 749 acres; Spring, 70-54, 690 acres; and Sutton, 70-94, 463 acres.

Nearly two-thirds of the lakes are affected by artificial drainage systems.

SHERBURNE COUNTY (71)

Number of lakes 168
Lake area, acres. 11,443

Ice blocks deposited in outwash plains formed most of the lake basins in the county. In the eastern half of the county many of the lakes have been partly filled with fine sand sediments derived from the Anoka sand plain area. A few of the small shallow lakes in Township 33 North, Range 26 West, may have been formed as a direct result of wind action which caused "blowouts" or holes excavated by the wind action.

The largest lakes in the county include: Rice, 71-78, 505 acres; Fremont, 71-16, 466 acres; Eagle, 71-67, 426 acres; and Briggs, 71-146, 406 acres.

Orono, 71-13, is a hydropower reservoir owned by the Village of Elk River. The reservoir was originally formed by a dam built across Elk River in 1851.

SHERBURNE COUNTY (71)

SIBLEY COUNTY (72)

Number of lakes 101
Lake area, acres. 16,062

Nearly all of the lake basins in the county were formed by the irregular deposition of glacial till. Most of the lakes are shallow and about two-thirds of them have been affected by artificial drainage. In the Minnesota River Valley along the eastern county boundary are a few scattered flood plain lakes. Buck, 72-10, is a typical oxbow basin formed by a meander cutoff of the Minnesota River.

SIBLEY COUNTY (72)

STEARNS COUNTY (73)

Number of lakes 294
Lake area, acres. 34,327

The lake basins in the county were formed from ice blocks deposited in till and in outwash and from the irregular deposition of till.

The basins formed by ice blocks deposited in till are located mainly along the St. Croix Terminal Moraine which extends in a general northwest-southeast direction across the county to the vicinity of Richmond. The eastern, south-central, and southwestern parts of the county are outwash plains which contain scattered lakes in ice block depressions. A band of outwash sediments also extends along the Sand River in the western part of the county from Sauk Center to New Munich. The areas between the moraines and outwash plains are rolling ground moraine containing ice block lakes and basins formed by the irregular deposition of till. The following table lists examples of types of lakes in the county.

Origin	Ident. No.	Name
Basins formed by the irregular deposition of till	73-273	McCormick
	73-258	George
Basins formed by ice blocks deposited in outwash plains	73-55	Grand
	73-278	Tamarack
Basins formed by ice blocks deposited in outwash in preglacial valleys	79-139	Long
	79-147	North Browns
	79-151	Mud
Basins formed by ice blocks deposited in till	79-106	Big Fish
	79-117	Big Spunk
	79-196	Rice

Large lakes located entirely within Stearns County

Ident. No.	Name	Area, acres
73-196	Rice	1,568
73-157	Horseshoe	995
73-133	Cedar Island	995
73-138	Two Rivers	756
73-37	Pearl	755
73-55	Grand	666
73-106	Big Fish	591

Koronis, 73-200, has the largest lake area in the county, 3,109 acres, but it is also in Meeker County where the lake has an additional 362 acres.

STEARNS COUNTY (73)

STEELE COUNTY (74)

Number of lakes 37
Lake area, acres. 5,488

Steele County lakes are mainly in shallow basins formed by the irregular deposition of till along the eastern and western borders of the county. Nearly 90 per cent of the lakes are affected by artificial drainage systems and many are dry most of the time.

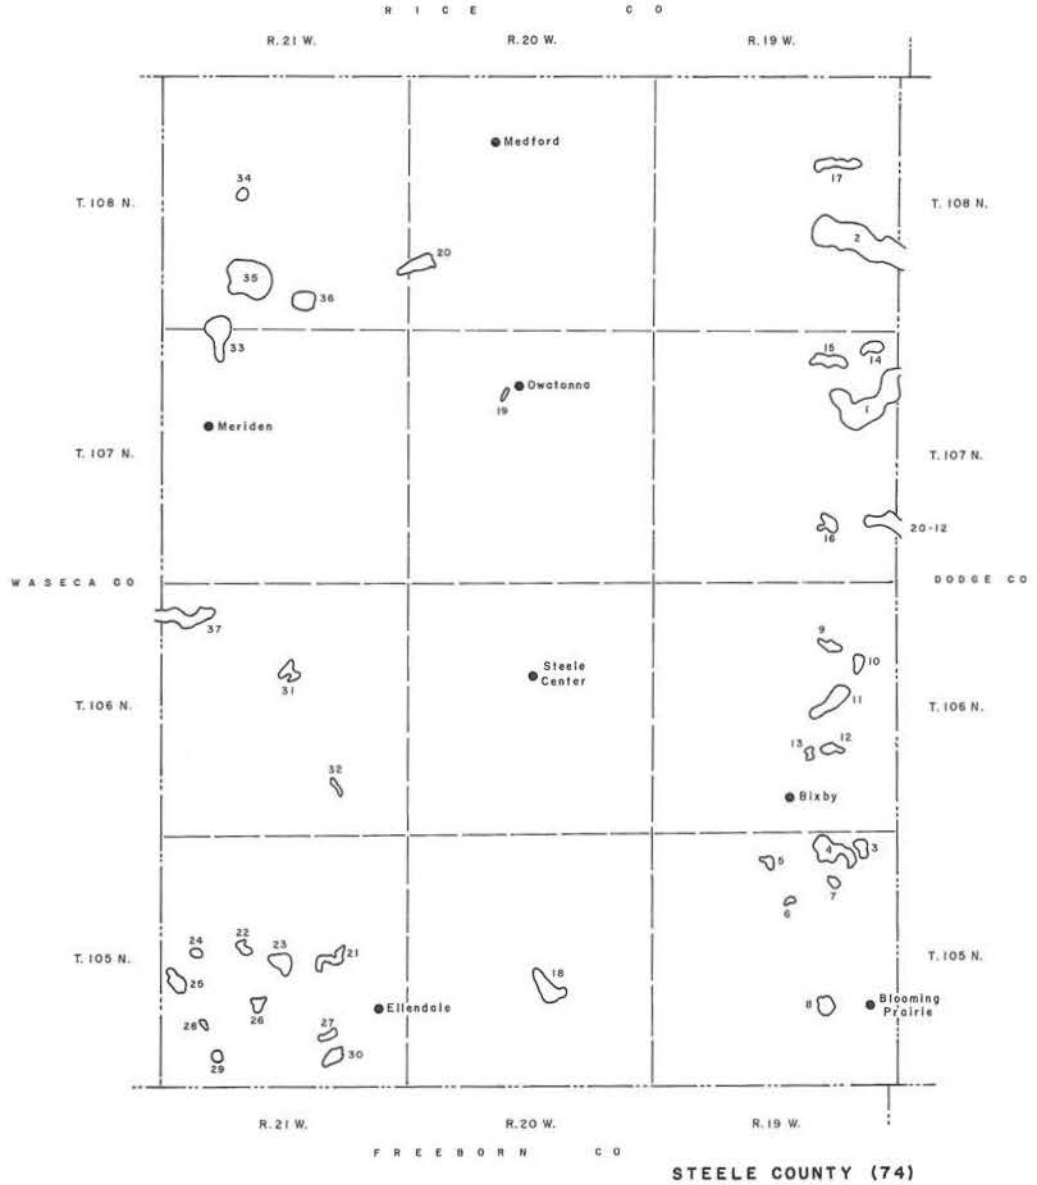

An unnamed lake, 74-2, is the largest in the county; it has a total area of 979 acres of which 876 are in Steele County. Rice, 74-1, has an area of 620 acres in Steele County and also 77 acres in Dodge County. Pelican, 74-35, 562 acres, is the largest lake entirely within the county.

STEELE COUNTY (74)

STEVENS COUNTY (75)

Number of lakes 313
Lake area, acres. 19,394

Many of the basins in the county were formed by the irregular deposition of glacial till. Several chains of lakes were formed by ice blocks deposited in outwash along preglacial valleys. One chain, in Township 126 North, Range 41 West, is located along the Pomme de Terre River Valley. It includes North Pomme de Terre, 75-61, Middle Pomme de Terre, 75-74, and Perkins, 75-75. Another chain in the northeast corner of Township 125 North, Range 42 West, includes North Wintermute, 75-125, Middle Wintermute, 75-105, and South Wintermute, 75-113. Ice blocks deposited in till formed some of the lake basins along the east-central part of the watershed in a morainal region. Round, 75-52, is a typical example.

Nearly half of the lakes listed in the county are affected by artificial drainage and many are dry most of the time.

The largest lakes in the county are: Moose Island, 75-238, 969 acres; Long, 75-24, 588 acres; Gorder, 75-203, 556 acres; and Perkins, 75-75, 519 acres.

STEVENS COUNTY (75)

SWIFT COUNTY (76)

Number of lakes 169
Lake area, acres. 12,393

Swift County lake basins were formed by ice blocks deposited in terminal moraine and in outwash and by the irregular deposition of till in ground moraine. Examples of types of basins are shown in the following table:

Origin	General location	Ident. No.	Name
Ice blocks deposited in till	Along eastern and western parts of the county	76-32 76-86	West Sunburg Hassel
Ice blocks deposited in till in preglacial valleys	Along western boundary of county in TS. 121, 122 N. R. 43 W.	76-160 76-148	Large Henry Griffin
Ice blocks deposited in an outwash plain	Area extending south of Clontarf to vicinity of Benson and Danvers	76-94 76-108	Johnson Lang Marsh
Irregular deposition of till	Northwestern and southeastern corners of county	76-3 76-141	Unnamed Shible

Large lakes in the county include: Shible, 76-141, 1,055 acres; Hassel, 76-86, 706 acres; and Oliver, 76-146, 513 acres. Half of the lakes in the county are affected by artificial drainage systems and many are dry most of the time.

Lakes classified by area

SWIFT COUNTY (76)

TODD COUNTY (77)

Number of lakes 215
Lake area, acres. 27,901

The majority of the lakes are located in the morainal regions along the eastern and southern parts of the county. Most of these are in basins formed by ice blocks deposited in till and by the irregular deposition of till. Lakes in the northeastern corner of the county and near Browerville were formed by ice blocks deposited in an outwash plain which extends southward from Wadena County into central and southern Todd County where it terminates in Township 128 North, Range 33 West.

Lakes of various origins in the county are listed in the table below:

Origin	Ident. No.	Name
Irregular deposition of glacial till	77-84	Big Birch
	77-215	Osakis
Ice blocks in glacial till	77-61	Rice
	77-34	Little Swan
Ice blocks in glacial till in preglacial valleys	77-23	Big Swan
	77-150	Sauk
Ice blocks in outwash plains	77-146	Rice
	77-128	Horseshoe
Ice blocks in outwash in preglacial valleys	77-77	Pine Island
	77-88	Turtle

Large lakes entirely within Todd County:

Ident. No.	Name	Area, acres
77-23	Big Swan	1,024
77-61	Rice	675
77-181	Maple	621
77-154	Fairy	557

Large lakes numbered in Todd County but also located in adjoining counties:

Ident. No.	Name	Area in Todd County	Acres, total
77-215	Osakis	5,602	6,768
77-150	Sauk	1,634	2,111
77-84	Big Birch	1,339	2,025
77-89	Little Birch	600	793

TODD COUNTY (77)

TRAVERSE COUNTY (78)

Number of lakes [1] 68
Lake area, acres. 9,991

The lakes in Traverse County are all located in the morainal region in the southeastern part of the county and along the boundary between Minnesota and South Dakota. The remainder of the county is in the basin of Glacial Lake Agassiz and is devoid of lakes.

The lake basins, with the exception of the two large basins located along the boundary, were formed by ice blocks deposited in till. Traverse, 78-25, the largest lake in the county, was formed by the damming action of the Little Minnesota River at the south end. Mud, 78-24, the other large basin along the South Dakota-Minnesota border was formerly a low marshy region. Traverse, 78-25, and Mud, 78-24, are presently utilized as federally owned and operated flood control and water conservation reservoirs which were placed in operation in 1941 as the Lake Traverse project on the Minnesota-South Dakota-North Dakota boundary. Mud is controlled by a dam at White Rock, South Dakota; Traverse is regulated by a control structure at the bridge on Trunk Highway 117.

WABASHA COUNTY (79)

Number of lakes[1] 6
Lake area, acres. 15,377

In addition to the two federal reservoirs, there are four lakes in the county. These are all located along the Mississippi River valley south of Wabasha in flood plain basins which resulted from the abandonment of overflow channels of the river.

U. S. Lock and Dam No. 5 pool, 79-1, was formed by a navigation dam constructed by the U. S. Corps of Engineers, in 1935, across the Mississippi River near Minneiska.

U. S. Lock and Dam No. 4 pool, 79-5, was formed by a navigation dam constructed by the U. S. Corps of Engineers, in 1935, across the Mississippi River at Alma, Wisconsin.

WABASHA COUNTY (79)

WADENA COUNTY (80)

Number of lakes 39
Lake area, acres. 3,802

The lake basins in Wadena County are found mainly in the north half of the county originating from ice blocks which were buried by the outwash plain that covers most of that region. Several unnamed lakes, 80-31 and 80-32, located in the west-central part of the county near Sebeka were formed by the irregular deposition of glacial till.

Nearly three-fourths of the lakes are affected by artificial drainage and many of them frequently become dry.

Blueberry, 80-34, is the largest lake in the county with an area of 555 acres. Several other large lakes include Yaeger, 80-22, 384 acres; and Stocking, 80-37, 356 acres.

WADENA COUNTY (80)

WASECA COUNTY (81)

Number of lakes 95
Lake area, acres. 11,743

Ice blocks deposited in till and the irregular deposition of till formed the lake basins in the county.

The lakes in the eastern part of the county, in Range 22 West, and along the northern border in Ranges 22 and 23 and part of Range 24 West, as far west as Elysian, 81-95, were formed by ice blocks deposited in till. Clear, 81-14, and Rice, 81-22, are typical examples. Elysian Lake was formed by ice blocks deposited in till along a preglacial valley.

Silver, 81-44, and Buffalo, 81-83, are representative of the basins formed by the irregular deposition of till in the remainder of the county.

Large lakes in the county include: Elysian, 81-95, 2,462 acres, including 19 acres in Le Sueur County; Buffalo, 81-83, 895 acres; and Clear, 81-14, 611 acres.

WASECA COUNTY (81)

WASHINGTON COUNTY (82)

Number of lakes[1] 168
Lake area, acres. 20,605

Nearly all of the lake basins in the county were formed from ice blocks deposited in glacial till. Big Marine, 82-52, and Forest, 82-159, are typical examples. White Bear, 82-167, Long, 82-118, and DeMontreville, 82-101, are ice block basins which were deposited in preglacial valleys. Elmo, 82-106 and Downs, 82-110, were formed by ice blocks deposited in outwash. St. Croix, 82-1, which is also part of U. S. Lock and Dam No. 3 Pool, was originally formed by the damming of Glacial River St. Croix by the Mississippi River which created a delta across the head of the basin.

Several flood plain lakes are located along the Mississippi River in the southern part of the county; these lakes are named on the map but not listed in the tabulation since they are considered part of U. S. Lock and Dam Pools.

Large lakes entirely within Washington County include Forest, 82-159, which has an area of 2,206 acres, and Big Marine, 82-52, which has an area of 1,577 acres. St. Croix, 82-1, has an area of 3,990 acres in Washington County and 4,180 acres in Wisconsin. White Bear, 82-167, comprises 1,255 acres in Washington County and 1,155 acres in Ramsey County.

WASHINGTON COUNTY (82)

WATONWAN COUNTY (83)

Number of lakes 61
Lake area, acres. 5,166

The majority of the lakes in the county were formed by the irregular deposition of till but there are several chains of lakes formed by ice blocks deposited in till in preglacial valleys. These are unnamed lakes, 83-3, -4, and -5, located in Township 105 North, Range 30 West, and in Township 105 North, Range 33 West, lakes 83-51 through 83-54, includes Sulem, School and Irish. These chains of ice block basins in till-filled valleys are the northern extensions of the larger chains of basins which extend through Martin County.

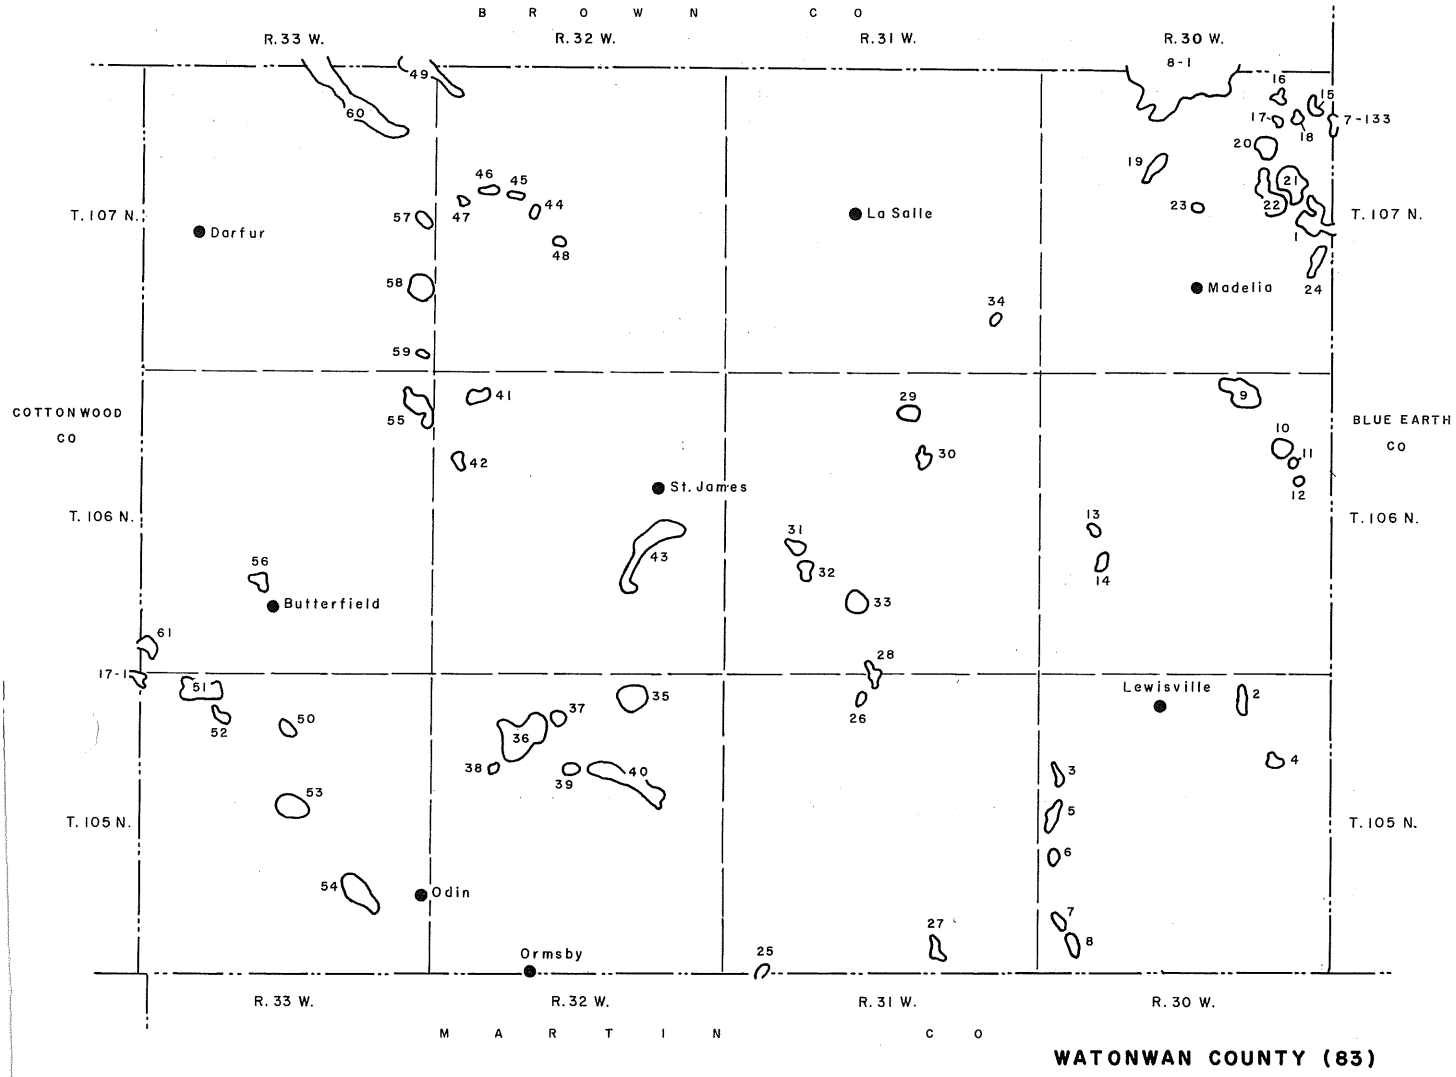

The largest lake area in the county is Emerson, 8-1, which has an area of 553 acres in Watonwan County. Most of this lake is in Brown County where it is primarily listed. Wood Lake, 83-60, is another large lake which also extends into Brown County. The area in this lake in Watonwan County is 452 acres; in Brown County, 185 acres.

WATONWAN COUNTY (83)

WILKIN COUNTY (84)

Number of lakes 25
Lake area, acres. 675

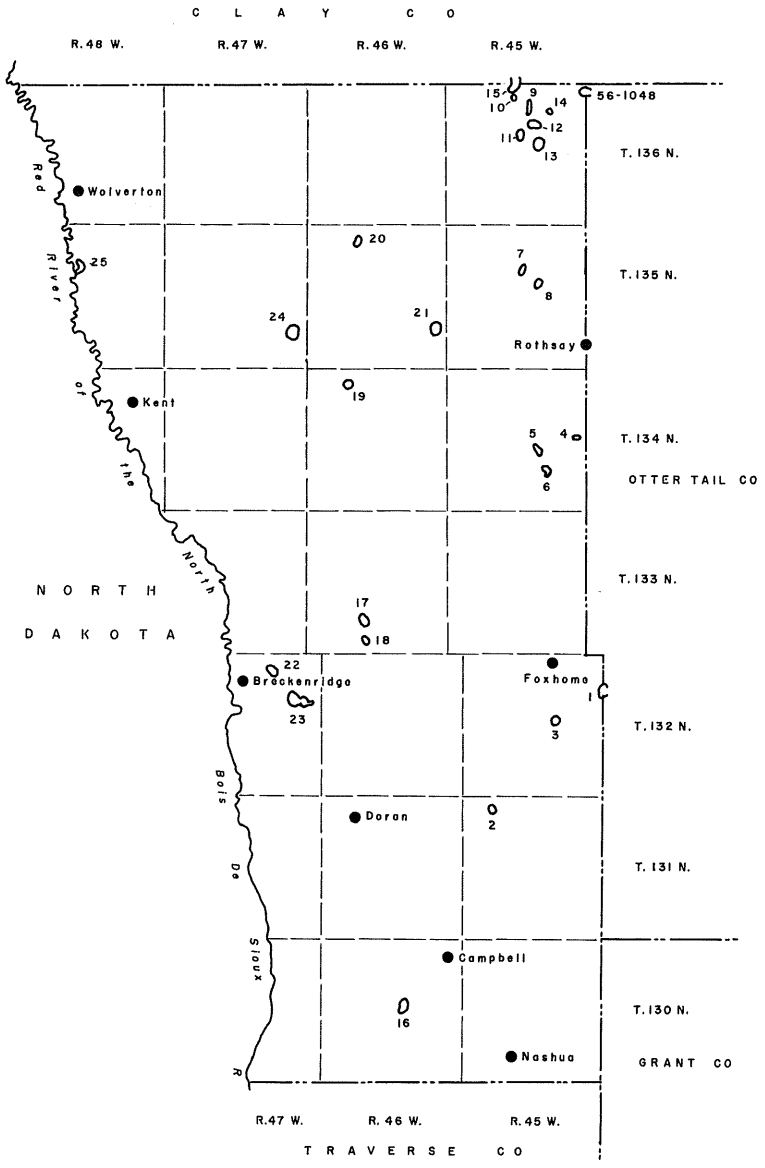

Basins in Wilkin County formed by the irregular deposition of glacial till are located in the gently rolling glacial hills of the northeastern part near Rothsay. The other small lakes scattered through the county were formed in shallow depressions adjacent to the numerous beach ridges of Glacial Lake Agassiz which covered all of the county except the northeastern corner. An unnamed basin, 84-25, in Township 135 North, Range 48 West, along the Red River Valley, is an oxbow basin formed by a meander cutoff of the Red River. There are no large lakes in the county.

Breckenridge Reservoir, 84-23, was formed by a dam constructed across the Otter Tail River near Breckenridge by the Works Progress Administration in 1935. The dam is now owned by the City of Breckenridge and utilized for recreation and water supply purposes.

WILKIN COUNTY (84)

WINONA COUNTY (85)

Number of lakes 13
Lake area, acres. 9,878

There are 10 flood plain lakes in Winona County in addition to the three federal reservoirs on the Mississippi River which forms the eastern border of the county. The flood plain lakes are in depressions of minor sloughs and temporary channels of the Mississippi River along a wide alluvial terrace near Winona.

Winona, 85-11, 318 acres, is the largest natural lake in the county.

Reservoirs in Winona County located on the Mississippi River along the Minnesota-Wisconsin boundary:

Ident. No.	Name	Remarks
85-1	U. S. Lock & Dam No. 7 Pool	Formed by dam located near Dresbach, constructed in 1937.
85-2	U. S. Lock & Dam No. 6 Pool	Formed by a dam located near LaMoille, constructed in 1936.
85-13	U. S. Lock & Dam No. 5A Pool	Formed by a dam located at Winona, constructed in 1935.

WRIGHT COUNTY (86)

Number of lakes 298
Lake area, acres. 44,834

The lakes in the county were formed by ice blocks deposited in till and in outwash and by the irregular deposition of till.

Outwash deposits in the county are located along the northern boundary and near the central part of the county between Buffalo and Montrose. The outwash in the northern part of the county is bordered on the south by rugged morainal hills, 2 to 10 miles wide. Morainal hills also extend along the western edge of the county and in several bands 2 to 3 miles wide across the central and southeastern parts of the county. A rolling till plain extends through the county between the morainal areas. The following table lists examples of types of basins found in the county:

Origin	Ident. No.	Name
Ice blocks deposited in till	86-90	Buffalo
	86-263	Cokato
	86-53	Pulaski
Ice blocks deposited in outwash plains	86-251	Pleasant
	86-252	Clearwater
	86-183	Fish

WRIGHT COUNTY (86)

YELLOW MEDICINE COUNTY (87)

Number of lakes [1] 126
Lake area, acres. 7,274

Most of the lake basins in the county are shallow and they were formed mainly by the irregular deposition of till. Three-fifths of the lakes are affected by artificial drainage systems and many of them are dry most of the time.

A group of lakes near St. Leo in the north-central part of the county were formed mostly by ice blocks deposited in till along a northwest-southeast morainal ridge which extends across the county.

Wood, 87-30, is an example of a lake basin formed by the irregular deposition of till. Miller, 87-102, is an example of an ice block basin in till.

The largest lakes in the county are: Sand, 87-26, 514 acres; Wood, 87-30, 484 acres; and Curtis, 87-16, 440 acres. The remainder of the lakes are small, generally less than 100 acres in area.

Lakes classified by area

	Area in acres									
	10 to 25	25 to 50	50 to 75	75 to 100	100 to 125	125 to 150	150 to 200	200 to 500	500 to 1000	Total

YELLOW MEDICINE COUNTY (87)

LAKE NAMES

This section includes the known names listed in alphabetical order, of all lakes of 10 acres or more in area in the State. It also contains alternate spellings by which the lake may be known or which may have been used on published maps. Names followed by an identification number in parentheses indicate alternate names by which the lake has been known. Abbey (86-132) for example, is an alternate name for Abbie 86-132. Many of the alternate names listed represent only changes in spelling, such as Agamak (38-11) for Agamok 38-11.

An asterisk preceding a lake name indicates that the name has been officially established by a decision of the U.S. Board on Geographic Names or of the State Geographic Board. For example, *Alpha 16-311 is a lake in Cook County. The name was established by U.S. Board on Geographic Names Decision No. 6202. Names of lakes or streams may be officially established or changed only by action of county boards as provided in Minnesota Statutes, Secs. 378.01-06, by a decision of the State Geographic Board or by a decision of the U.S. Board on Geographic Names.

It is emphasized that the names listed in this index, except for those preceded by an asterisk*, do not represent official names but do represent an attempt by the Division of Waters, Soils and Minerals to select a preferred name. Many of the lakes listed may have been known locally for years by other names. It was not possible to make a detailed field investigation of local name usage.

The assistance of the public in supplying reliable information on corrections in names will be appreciated. There are many lakes listed in the inventory for which no names were found; if there is good evidence supporting a name by which a listed unnamed lake has been known locally for a number of years, the information will be gratefully accepted and submitted to the State Geographic Board for approval.

It is obvious from the list of names that there are many lakes in the State which have identical names. The most common lake name is "Mud" which is the preferred name of 192 lakes and is the alternate name for 69 other lakes. There are 156 Long Lakes listed, including 118 with the preferred name and 38 which are alternates.
