

# **PROGRESS REPORT ON GRASS SEED PRODUCTION RESEARCH**

prepared by

N. Ehlke, D. Vellekson, and D.Grafstrom

Department of Agronomy and Plant Genetics

University of Minnesota

St. Paul, Minnesota 55108

## **Grass-Legume Seed Institute Presentation**

**Roseau, MN - February 26, 2025**

This summary and previous annual research summaries are on the Web at:

***<https://turf.umn.edu/seed-production-research-progress-reports>***

Table 1. Precipitation/Weather Data 1967-2024.

### **Variety Performance Trials:**

Table 2. Perennial Ryegrass Seed Production Seeded in 2023.

Table 3. Perennial Ryegrass Winter Hardiness Trials Seeded in 2023.

Table 4. Kentucky Bluegrass Seeded in 2020.

Table 5. Kernza Seeded in 2020.

Table 6. Field Pea Quality Trials-2022-24.

### **Perennial Ryegrass Management Trials:**

Table 7. Fertility Trial-MagPlots.

Table 8. Annual Summary of Fertility Trials-MagPlots.

Table 9. Herbicide Screen-MagPlots.

### **Other Trials:**

Table 10. Hard Fescue Fertility Trial-MagPlots.

Table 10a. Hard Fescue Growing Degree Days(GDD) Model.

Table 11. 2022-24 Fall Plant- Cover Crop Seed Production-MagPlots.

Table 12. 2023-24 Spring Plant- Cover Crop Seed Production--MagPlots.

Table 13. 2023-24 Cover Crop Species Evaluation-MagPlots.

Table 14. 2022-23 Red clover Cover in Rye-MagFarm-MagPlots.

Table 15. 2022-23 Fall Fertilizer Added to Ryegrass Cover-MagPlots/Pearson.

Table 16. 2024 Army Worm Moth Capture Survey/Summary.

Table 17. Bertha Army Worm and Diamondback Moth Monitoring.

## **Standard Management Practices for University of Minnesota Grass Seed Production Research Plots**

### ***General management regime of research plots in Northern Minnesota:***

#### **Spring seeded ryegrass with wheat-BMP(best management practice)**

Ryegrass seeded at 5-7#/acre with spring wheat

Sterling Blue(dicamba)+ 2,4-D amine 4 (0.75 + 0.75 pint) applied in late September

Fertilize 30-50-50 after small grain harvest

Spike tooth harrow after fall fertilizer application to spread straw

Fertilize 110-0-0-20s(15#ESN) applied early May, 300 - 600 GDD

Sterling Blue+ 2,4-D amine 4 (0.75+0.75 pint) applied late May, 700 - 900 GDD

Tacoma or Assure II (8-10 oz) applied early June, 800 - 1,000 GDD

Apogee (6-8 oz) applied early heading, 1,100 - 1,300 GDD

Priaxor 6oz.or Quilt Xcel 12oz. applied full heading, 1,700 - 1,900 GDD or as needed

#### **Fall seeded ryegrass in wheat stubble**

Pre-harvest glyphosate application to wheat , or

glyphosate applied to wheat stubble prior to seeding ryegrass, if needed.

Drill ryegrass at 5-7#/acre after wheat harvest into existing stubble

Fertilize 30-50-50 at planting

If planting into summer fallow, apply 11-50-50.

#### **Intermediate Wheatgrass/Kernza**

Establishment=Seed at 10#/acre in late August in 6"-8" rows.

120-40-40-10s applied in late October.

.75pt. 2,4-D a + .75pt. Sterling Blue late September or May if needed.

Field burn in early September after harvest.

#### **Kentucky bluegrass**

Establishment=Seed at 4#/acre in late August to early September.

120-40-40-10s applied in late September.

.75pt. 2,4-D a + .75pt. Sterling Blue late September.

Field burn in August.

#### **General seed harvest procedure for small research plot**

*Note: Years sited on the summary tables are generally the year the trial was planted or initiated.*

Measured areas are hand cut and bagged for each individual plot.

These samples are then brought to the U of M St.Paul campus

where they are dried, threshed, cleaned and weighed.

Seed yields, quality and other data are statistically analyzed and results summarized.

#### **On-farm small plot research trials**

General crop management is done by the grower/cooperator.

Application of treatment variables, agronomic notes and harvest performed by U of Mn personnel.

Effort is made to remove research samples prior to grower harvest.

Cooperators are asked to avoid management applications of treatments involved in the study to the research plot area.

#### **On-farm large plot trial research protocol**

These experiments are conducted in fields with growers implementing all of the general field management.

Treatment variables are field scale and are applied either by the grower or University personnel.

University agronomists and grower cooperators work together to insure treatment variables are properly applied.

Plant samples, crop development observations and other applicable notes

are recorded as needed throughout the growing season usually by University personnel.

At harvest, University agronomists will assist the growers in collecting quality samples and recording harvest data.

Experimental design usually consists of 2 or 3 treatment variables and 3 replicates/treatment.

#### **2024 Research Locations**

MagPlots=University of Minnesota-Magnusson Research Farm 2 miles north and 4.5 miles west of Roseau,Mn

Northern Resources=West Plant-Roseau Kevin Johnson farm

MagFarms=Magnusson Farms- NW of Roseau Mark Melby farm

Casey Pearson=NW of Roseau Tony Wensloff farm

Rice Farms= NW of Roseau

Estling Farm=North of Roosevelt

Stanley Farms=Grygla area

Table 1.

Table 10a .

**MNHD Hard Fescue GDD in Northern MN**

The 2024 season was the first year that data was collected to predict a growing degree day (GDD) model in MNHD hard fescue seed production at the U of MN Magnuson Research Farm near Roseau, MN.

A degree of caution is needed when using these GDD numbers in MNHD hard fescue as the data set is only from one year.

Several more years data will be required to improve the confidence in using GDD to predict the critical growth stages in MNHD hard fescue.

The accumulation of GDD's began after snow melted from the MND hard fescue field and continued through swathing.

A base temperature of 32 degrees F was used for MNHD hard fescue (T-Base = 32 F).

Formula to calculate GDD:

$$\frac{(\text{Daily High Temp} + \text{Daily Low Temp})}{2} - 32$$

2

The following data, rounded to the nearest ten GDD's, was collected from a first-year MNHD seed production field. This MNHD hard fescue field was seeded in May of 2023 and data collection began after snow melt in 2024.

Plans are in place to collect additional data in the 2025 growing season to strengthen the GDD data base for MNHD hard fescue grown for seed production in the environmental conditions of northern MN.

**True Armyworm (*Mythimna unipuncta*) Moth Trapping Project in Roseau and Lake of the Woods Counties - Summary Report for 2024**

In 2020, a wide-spread outbreak of true armyworm (*Mythimna unipuncta*), and the subsequent feeding, caused significant damage to perennial ryegrass fields in NW MN. Reported ryegrass seed yield losses ranged from 0 to over 80%. The most severe damage occurred over the July 4th weekend.

Armyworms do not overwinter in northern MN but are transported into the area from southern states by low-level jet streams and southerly winds. To document armyworm moth flights into the perennial ryegrass growing region of MN, an armyworm moth trapping project was conducted in 2024. The objectives of this project were to determine: 1) the onset of armyworm moth migration and, 2) the scope and severity of armyworm moths in perennial ryegrass seed fields. Armyworm moths (males only) were trapped with a pheromone trap which were installed on field edges, or in the middle of grass seed fields. These pheromone traps were affixed to a shepherd hook and hung approximately 4 feet off the ground at six locations in NW MN.

**Armyworm Moth Capture - 2024**

Cold fronts were the dominate weather pattern in April and early May.

The North Dakota Agricultural Weather Network (NDAWN) site at the U of MN Magnusson Research Farm documented winds from a north to northwest direction in 23 out of 30 days in April and 10 days in the first half of May.

In the second half of May, winds switched to more of a southerly direction and south winds were recorded in 7 of 16 days from May 15-31 and in 12 out of 30 days in June. In the first half of June southerly winds were recorded on June 1&2, 4&5 and 14-16.

Further, wind speeds of over 20 mph were recorded in 11 days in the latter half of May and in 19 out of 30 days in June.

In 2024 all armyworm moth capture sites were in perennial ryegrass fields as previous data indicated that perennial ryegrass seemed to be the preferred site for armyworm moth activity.

Scentry pheromone wing traps were placed in perennial ryegrass fields on May 14 & 15.

Traps were inspected weekly, until moth capture, and every two to three days after moth capture and again, weekly, if no moths were captured in the trap.

Armyworm moths were trapped on a sticky board and these trapped moths were removed from the sticky trap.

In heavy moth flights, a new sticky base replaced the one covered with moths.

A new pheromone lure replaced the old lure every three weeks.

The following farmer cooperators were willing to have armyworm traps in or near perennial ryegrass fields.

Jade Estling, Kevin Johnson, Troy Johnson, Mark Melby, Brian and Sheldon Rice and Tony Wensloff.

Without the cooperation of these individuals this armyworm trapping project would not be possible. Thank you for your cooperation.

**The six armyworm moth trapping locations in perennial ryegrass seed production fields in 2024:**

**Location 1:** Falun Township, Section 22. Trap placed in the middle of a ryegrass field.

**Location 2:** Stafford Township, Section 14, SW quarter. Trap placed on the edge of a ryegrass field.

**Location 3:** Jadis Township, Section 6. Trap placed in the edge of a ryegrass field.

**Location 4:** Ross Township, Section 4. Trap placed in the middle of a ryegrass field.

**Location 5:** Laona Township, Section 10. The trap was in a field boundary of two ryegrass fields.

**Location 6:** Lind Township, Section 4. The trap was placed on the edge of a ryegrass field.

**Table 2. True Armyworm (*Mythimna unipuncta*) moth capture at six locations in Roseau County in 2024**

<b>Date</b>	<b>Location</b>						<b>Total</b>

18-Jun	1	14	2	18	17	3	55
24-Jun	3	17	2	12	16	4	54
30-Jun	0	9	0	13	12	NA	34
<b>Total</b>	<b>66</b>	<b>131</b>	<b>83</b>	<b>148</b>	<b>170</b>	<b>124</b>	<b>722</b>

In 2024, this armyworm moth trapping project documented four significant moth captures that averaged over 3 moths/night.

The calendar dates and the number of moths collected from the previous six days were:

- May 20 = 128
- June 26 = 118
- June 6 = 175
- July 12 = 98

Low-level jet streams have been documented to transport insect and disease pests into northern regions of the United States.

These low-level jet streams, which are monitored by the University Center for Atmospheric Research (UCAR), move at wind speeds of 30-80 mph and are from 330 to 3000feet in elevation. These low-level jet streams are associated with a thunderstorm or rain event that aids in the deposit of armyworm moths. These low-level jet stream data will be an important tool in the monitoring of armyworm moth movement into the perennial ryegrass growing regions of northern MN.

**Summary**

Over a three-year period, this armyworm moth trapping project documented that the Scentry pheromone wing trap was effective in trapping armyworm moths. This moth trapping project documented four major flights in 2022, five in 2023 and four flights in 2024

Low-level jet stream maps produced by the University Center for Atmospheric Research (UCAR), can be used to document low-level jet stream events in the perennial ryegrass growing regions of northern MN.

Localized thunderstorms and rain events seem to be important in the deposition of armyworm moths into the perennial ryegrass growing region of northern MN.

The next step in this project will be to build information learned from this armyworm moth trapping project and try and determine a correlation between the number of trapped moths and number of armyworm larvae in ryegrass fields.
