SUMMER ACTIVITY EXPANSION REPORT

INTER-REGIONAL FLOWS

Introduction

Report Number 24 outlines the methodology followed by the Institute of Outdoor Recreation and Tourism to arrive at the figures in the tables included in Appendices A and B. Briefly, the telephone administered questionnaire yielded responses to questions about the respondents and respondents' family's recreation occasions on 31 different activities during a one week recall period. The survey tabulated the frequency of occasions by activity type by region of origin and region of occurrence. The task then was to "clean" the data, expand the weekly totals to seasonal totals, then estimate the population parameter from the sample statistic.¹

In the remainder of this report, we have outlined the meaning of the confidence intervals and how one should interpret the tables presented in the Appendices. (Activity patterns are reported as percentages and absolute activity occasions, and identified by region of origin as well as region of occurrence.

Confidence Intervals

Anytime such an expansion is performed, there exists a possibility that the population estimate is not the true value of the population. Confidence intervals are calculated to determine at a particular level of chance the likelihood that the true population value lies between some value higher than the population estimate and some value lower than that estimate. In consultation with representatives from the Minnesota Department of Natural Resources, IORT has calculated the confidence intervals at the 75 percent likelihood level. Hence,

for the expansion tables found in Appendix A, activity occasions are presented in pairs. The upper number is an estimate of the population parameter, the expanded number of activity occasions generated by the residents of a region and occurring in some region. The lower number is the confidence interval for the estimate of activity occasions at the 75 percent level of confidence. If one were to consult the expansion table for bicycling recreation, Table 6 A, the cell defined by column 6E, row 6E contains the following number pair:

1,286,619
79,663

The best estimate of the total bicycling activity occasions by region 6E residents (represented by column 6E) occurring in region 6E (represented by row 6E) based upon our sample expanded to the population level is 1,286,619 bicycling activity occasions. And, we are 75 percent certain that the true number of occasions lies between 1,206,956 and 1,366,282 (1,286,619 plus 79,663 and 1,286,619 minus 79,663) bicycling activity occasions.

Interpreting Tabulating Values

The appendices tables which follow are presented by activity and show the region of residence for the recreator on the horizontal axis. On the vertical axis or reading down the table, the regions where the activity occasions occurred are listed. There are 13 columns across each table excluding the last column of row totals. These 13 columns represent the 13 regions of origin for activity occasions. Each table also has 14 rows excluding the last row for column totals. The first 13 rows represent the 13 regions where activity occasions occur. The 14th row is an out-of-state category. The body of this report also has tables, a Table One and a Table Two. Table One lists the counties located in each of Minnesota's 13 regions. Table Two lists the 31 different recreation activities covered by the telephone survey and by this scorp Report. How do we interpret the numbers?

¹An extensive discussion of this methodology can be found in SCORP Report Number 2315; Methodology for the Calculation of Outdoor Recreation Participation and Inter-regional Recreation Participation Flows.

If we were to use the same Appendix A, Table 6A number pair previously discussed:

1,286,619
79,663

they would be interpreted as follows. Our best estimate of the total bicycling occasions generated by residents of region 6E and occurring in Region 6E is 1,286,619. And, the 75 percent confidence interval is defined by this estimate plus or minus 79,659. By consulting Table 6A in Appendix A, one can also determine the number of activity occasions generated by residents of region 6E which occur in other regions. For example, region 6E residents are basically home-to-home recreational bicyclists. However, their next favorite region in which to bicycle is region 11 with 18,606 activity occasions. Also, region 6E is a fairly attractive place for recreational bicyclists from region 6W (34,593 activity occasions) to recreate.

The row totals are listed on the right hand margin and represent the total activity occasions occurring in a given region. The column totals are listed below the table and represent the total activity occasions generated by the residents of a given region. The row totals are listed in pairs. The upper number is, of course, the sum of the activity occasions occurring in a given region. The lower number is the sum of the confidence intervals about each estimate for activity occasions occurring in a given region regardless of the region of origin of the recreators.

As with the winter recreation study, many activity occasions have zero responses. However, when comparing the summer inter-regional flows to the winter inter-regional flows, one can correctly conclude that summer recreation is a more important part of Minnesota residents' time and that residents are more mobile during the summer period than during the winter. We do issue a similar caution with respect to interpreting the zero response found for

many of the less popular summer recreation activities just as we did in an earlier SCORP Report (2316) on winter inter-regional flows. One should not interpret the lower zero to imply that we are 75 percent certain that the true activity occasions for any given "zero" cell is zero. In point of fact, no confidence interval can be calculated as there are no observations in the sample upon which an estimate can be made, hence, the zero response. If the survey's sample size were expanded to almost equal the population size it is very likely that, where these tables show zero movement, some movement of recreators between regions would be identified. These additional movements were missed by our sample's smaller size and corresponding ability to identify only the most pronounced movements. One should correctly interpret the zero response to mean that the frequency of activity occasions was so small that the sample included no responses.

The sample size was of sufficient size to discover the several most important regions of recreation occurrence by persons residing in a given region. A more subtle review of the tables will show that home region activity occasions are by far the most frequent just as they were during the winter period. As activities appear more often in the sample, the confidence intervals about the estimates are "tighter" indicating a more precise estimate for home region activity estimates than for activity occasions "exported" to another region.

Thus far, our discussion has focused on the first of the set of tables, those which show activity occasions. The second set of tables found in Appendix B lists the percentage of the total activities occurring in a given region generated by residents of a given region. This is the upper of the pair of numbers. For example, one would interpret the pair of numbers for recreational bicycling in Table 6 Appendix B as follows:

97.0
96.0

These numbers appear in column six row six of Table 6B. The upper

number indicates that 97% of the activities in region 6E were generated by residents of region 6E. The lower number indicates that 96.0% of the total activity occasions generated by residents of region 6E occurred in region 6E. Therefore, 4.0% of the activity occasions generated by residents of region 6E occurred in other regions or out-of-state. Hence, for this activity type and these recreators, there was a definite home-to-home recreation preference.

Tables One and Two found on pages six and seven list the thirteen Minnesota development regions and the 31 different activity types which were the focus of this study. Following Tables One and Two, Appendices A and B present the expanded activity occasions and percentage of activity occasions in tables illustrating the inter-regional flows for each activity.
