**Return Rates of Adults  
Released from Minnesota  
Correctional Facilities  
During 1993**

Information Technology and Research Unit  
Minnesota Department of Corrections  
1450 Energy Park Drive, Suite 200  
St. Paul, Minnesota 55108  
(612) 642-0301

February 26, 1996

The tables on the following pages present release and return information for adults released from Minnesota Correctional Facilities during 1993. Return information is broken down by race, gender, type of release (supervised release, parole, intensive community supervision [ICS], Challenge Incarceration Program Phase II [CIP], or discharge), offense category, and type of return (with or without a new sentence).

Return rates are determined using CMIS status, sentence, and identification files. The status database (OIDSTS) contains one or more records corresponding to each change in an offender's status. Each OIDSTS record stores the date, status action, supervising authority, and offender location corresponding to that status. ("Statuses" include "incarcerated," "supervised release," "on parole," "fugitive," "in hospital," and so on. The "status action" gives additional information about the inmate's status; for instance, status actions that commonly appear with a status of "incarcerated" include court commitment, transfer, and return from release.)

A file was created containing a combination of status and identification (race, gender, age) information for each adult OIDSTS record in CMIS. The records in this new file were sorted first by OID, then by "status date" and "time of movement," from oldest to most recent. Additional files were created which contained the OID, admission date, and offense information for each adult sentence stored in CMIS, also sorted in the same way. A computer program was written to read through these files, identify the 1993 releases, and then see whether they subsequently returned to a Minnesota Correctional Facility. A simplified description of the logic employed is given below.

The program reads through the first offender's status records until it finds a court-commit incarceration. It then continues reading through this offender's status records, looking for the offender's first release following the incarceration. If this release was in 1993, it then reads on to see if the offender was subsequently reincarcerated. If the release was prior to 1993, it continues looking through the offender's status records to see if there was a court-commit incarceration for which there was a 1993 release. If the offender has a 1993 release, a record is created in an output file for the offender, giving his OID, race, gender, age at incarceration, type of release, and "return category." ("Return categories" represent all possible outcomes: no return to a MCF, return with a new sentence within a period of 6, 12, 18, etc. months, or return without a new sentence within various time intervals.) The program proceeds in this manner to read each offender's adult status records, and to capture the needed information for 1993 releases.

As described above, not every "incarceration" status record qualifies as a "commitment"—the beginning step of the search for an offender's commitment, release, and return; only court-commit incarcerations begin this sequence. Also, not every release is considered by the program logic—just the "first release" after the inmate's court-commit incarceration. This logic results in findings which exclude double-counting of inmates, are consistent with a natural understanding of the concept of "return rates," and are obtainable from the source data. One release (the first) is counted per court commitment, and one return (the first...if there are any returns at all) corresponding to that release is counted. Examples of how this works are described below.

An inmate who goes on supervised release and does not return to prison will have an OIDSTS record documenting his supervised release, and eventually will have an OIDSTS record with the status of "discharged." While the computer program considers supervised release, parole, ICS, CIP Phase II, and discharge all as "releases," the program logic avoids double-counting this inmate in determination of return rates by only counting his first release from prison (his supervised release). Double-counting is avoided not only within the release-year of interest, but also from one year to another.

Similarly, multiple counting of returning offenders is not done by the program. For example, suppose the following sequence of events occurs:

- a) an offender is incarcerated due to a court commitment
- b) he is placed on supervised release
- c) he returns as a technical violator (without a new court commitment)
- d) after some time in prison he is again placed on supervised release
- e) he returns to prison once again

Events a, b, and c constitute a commitment-release-return sequence that the program would count (assuming that the supervised release is in the target year). However, events d and e would not be counted as a release and return in the report. Thus the return data in this report shows the number of court commitments for which the offender was released in 1993, and returned after release.

There were three offenders who were discharged by the court in 1993 after their sentences were overturned, who were subsequently retried on the same offense, reconvicted, and reincarcerated. These cases were excluded from this study because they don't fit any of the return categories.

In accordance with this approach, Table 1 does not report all releases which occurred during 1993 (that information is available from sources such as the "Monthly Institution Admission and Release Report"). As indicated by the table heading, Table 1 gives the number of inmates for whom their first release following a court commitment occurred during 1993. The data are broken down by type of release, race, and gender.

The Table 1 numbers provide the denominators for the percentages given in Tables 2 and 3. For instance, in Table 3, the 153 white males who returned with a new court commitment within 24 months after their supervised release constitute 16% of the 947 white male supervised releasees shown in Table 1. Tables 2 and 3 show how many releasees returned to prison within 12 and 24 months respectively. The Table 3 (24-month return rates) data is cumulative; that is, it includes all the returns reported in Table 2 (12-month follow up) plus those that occurred during the second year after release.

Tables 2, 3, and 6 give return rates for offenders in various release categories. The reader should not interpret this data to mean that releasees necessarily committed their new offense while still in the program (supervised release, parole, ICS, or CIP Phase II) to which they were released. The offender's sentence may have expired, or the offender may have been placed under a different form of community supervision before the individual reoffended.

The return rate information of Tables 4 through 6 takes into account the offense for which the offender was originally committed, and the offense (if any) with which he/she returned. The offense categories used are the Minnesota Offense Code (MOC) general index categories. The offense types (person, property, drug, other) used in these tables were obtained by combining MOC offense categories as follows:

- Person:* assault, homicide, kidnapping, criminal sexual conduct, robbery
- Property:* burglary, forgery/counterfeiting, arson, property damage, stolen property, theft, theft related, vehicle theft
- Drug:* drug
- Other:* escape/flight, gambling, crime against family, traffic/accidents, miscellaneous, disturbing peace, obscenity, weapons, crime against administration of justice, crime against government, sex related, missing
